

# Principles of Concurrency

## Lecture 16 Erlang and Go

# Example

2

Suppose we have  $N$  threads (or processes, tasks) that form a ring  
Each thread communicates with its neighbor forwarding a message  
How big can we make the ring?  
How long does it take to send a message?

# Erlang Philosophy

3

## Independent processes

- suitable for executing on distributed machines

## No sharing

- (Deep) copy data sent on messages
  - no cross-machine pointers
  - no locks, data races, synchronization issues, ...

## All processes have a unique name

## Asynchronous sends, synchronous receives

- Eventual delivery
- But if A sends messages m1 and m2 to B, m2 will never arrive before m1
- guarded commands
- dynamic thread creation
- synchronous message passing
  - an input action in a guarded command causes the actions in the guard to block until the input action can be satisfied
    - there is a matching output action
- *No communication through global (shared) variables*

# Key features

4

## Functional

- single assignment (every variable assigned to at most once)

## Lightweight first-class processes

## Pattern-matching

## Small collection of datatypes

- lists, tuples, pairs

## Dynamic typing

## Realtime concurrent garbage collection

# Examples

5

```
-module(math).  
-export([fac/1]).
```

```
fac(N) when N > 0 -> N * fac(N-1);  
fac(0)             -> 1.
```

```
> math:fac(25).  
15511210043330985984000000
```

---

```
lookup(Key, {Key, Val, _, _}) ->  
    {ok, Val};  
lookup(Key, {Key1, Val, S, B}) when Key < Key1 ->  
    lookup(Key, S);  
lookup(Key, {Key1, Val, S, B}) ->  
    lookup(Key, B);  
lookup(Key, nil) ->  
    not_found.
```

# Examples

6

```
append([H|T], L) -> [H|append(T, L)];  
append([], L) -> L.
```

---

```
sort([Pivot|T]) ->  
  sort([X|X <- T, X < Pivot]) ++  
  [Pivot] ++  
  sort([X|X <- T, X >= Pivot]);  
sort([]) -> [].
```

---

```
> Adder = fun(N) -> fun(X) -> X + N end end.  
#Fun  
> G = Adder(10).  
#Fun  
> G(5).  
15
```

# Concurrency

7

```
-module(m).  
-export([loop/0]).  
loop() ->  
    receive  
        who_are_you ->  
            io:format("I am ~p~n", [self()]),  
            loop()  
    end.  
1> P = spawn(m, loop, []).  
<0.58.0>  
2> P ! who_are_you.  
I am <0.58.0>  
who_are_you
```

# Concurrency

8

```
-module(counter).  
-export([start/0, loop/1]).  
  
start() ->  
    spawn(counter, loop, [0]).  
  
loop(Val) ->  
    receive  
        increment -> loop(Val + 1)  
    end.
```

## Issues:

- Cannot directly access counter value.
- Messaging protocol is explicit (via message increment)

# Refinement

9

```
-module(counter).  
-export([start/0,loop/1,increment/1,value/1,stop/1]).  
  
%% First the interface functions.  
start() ->  
    spawn(counter, loop, [0]).  
  
increment(Counter) -> Counter ! increment.  
  
value(Counter) ->  
    Counter ! {self(),value},  
    receive  
        {Counter,Value} -> Value  
    end.  
  
stop(Counter) -> Counter ! stop.  
  
loop(Val) ->  
    receive  
        increment -> loop(Val + 1);  
        {From,value} -> From ! {self(),Val}, loop(Val);  
        stop -> true;  
        Other -> loop(Val)  
    end.
```

# Concurrency

10

```
-module(m).  
-export([start/0, ping/1, pong/0]).  
  
ping(0) ->  
    pong ! finished,  
    io:format("ping finished~n", []);  
ping(N) ->  
    pong ! {ping, self()},  
    receive pong ->  
        io:format("Ping received pong~n", [])  
    end,  
    ping(N - 1).  
  
pong() ->  
    receive  
        finished -> io:format("Pong finished~n", []);  
        {ping, Ping_PID} ->  
            io:format("Pong received ping~n", []),  
            Ping_PID ! pong,  
            pong()  
    end.  
  
start() -> register(pong, spawn(m, pong, [])),  
           spawn(m, ping, [3]).
```

# Example

11

```
module(prodcon).  
-export([start/0, consumer/0, producer/3]).  
  
producer(_, _, 0) -> true;  
producer(Me, Server, N) ->  
  Server ! {Me, N},  
  producer(Me, Server, N-1).  
  
consumer() ->  
  receive  
  {Them, N} ->  
    io:format("~s ~w~n", [Them, N]),  
    consumer()  
  end.  
  
start() ->  
  Server = spawn(prodcon, consumer, []),  
  spawn(prodcon, producer, ['A', Server, 10]),  
  spawn(prodcon, producer, ['B', Server, 5]),  
  io:format("finished start~n", []).
```

**Asynchronous, but no guarantees or notifications to the producer that the consumer has actually received its messages.**

# Acks

12

```
-module(prodcon).  
-export([start/0, consumer/0, producer/3]).  
  
producer(_, _, 0) -> true;  
producer(Me, Server, N) ->  
  Server ! {self(), Me, N},  
  receive {Server, ok} ->  
    true  
  end,  
  producer(Me, Server, N-1).  
  
consumer() ->  
  receive  
  {Pid, Them, N} ->  
    io:format("~s ~w~n", [Them, N]),  
    Pid ! {self(), ok},  
    consumer()  
  end.  
  
start() ->  
  Server = spawn(prodcon, consumer, []),  
  spawn(prodcon, producer, ['A', Server, 10]),  
  spawn(prodcon, producer, ['B', Server, 5]),  
  io:format("finished start~n", []).
```

# Distributed Programming

13

Can generalize previous example to a distributed environment

```
-module(m).  
-export([start/0, ping/2, pong/0]).  
  
ping(0,Pong_Node) ->  
    {pong, Pong_Node} ! finished,  
    io:format("ping finished~n", []);  
ping(N,Pong_Node) ->  
    {pong, Pong_Node} ! {ping, self()},  
    receive pong ->  
        io:format("Ping received pong~n", [])  
    end,  
    ping(N - 1, Pong_Node).  
  
pong() ->  
    receive  
        finished -> io:format("Pong finished~n", []);  
        {ping, Ping_PID} ->  
            io:format("Pong received ping~n", []),  
            Ping_PID ! pong,  
            pong()  
    end.  
  
start_pong() -> register(pong, spawn(m, pong, [])),  
start_ping(Pong_Node) -> spawn(m, ping, [3, Pong_Node]).
```

On one host: `erl -sname ping`

On another: `erl -sname pong`

On one node:

`M:start_pong().`

On another:

`M:start_ping(pong@<host>).`

# Monitoring

14

```
...  
process_flag(trap_exit, true),  
Pid = spawn_link(fun() -> ... end),  
receive  
    {'EXIT', Pid, Why} ->  
        ...  
end
```

# Client/Server

15

```
server(Fun, Data) ->
  receive
    {new_fun, Fun1} ->
      server(Fun1, Data);
    {rpc, From, ReplyAs, Q} ->
      {Reply, Data1} = Fun(Q, Data),
      From ! {ReplyAs, Reply},
      server(Fun, Data1)
  end.
```

```
rpc(A, B) ->
  Tag = new_ref(),
  A ! {rpc, self(), Tag, B},
  receive
    {Tag, Val} -> Val
  end
```

# Concurrency Patterns

16

## *Unicast*

A ! B

## *RPC call*

```
Call (RPC)
  A ! {self(), B},
  receive
    {A, Reply} ->
      Reply
  end
```

## *Event Handling*

receive A -> A end

## *Callback*

```
receive
  {From, A} ->
    From ! F(A)
end
```

# Concurrency Patterns

17

## *Callback within RPC*

```
A ! {Tag, X},  g(A, Tag) .
```

```
g(A, Tag) ->  
  receive  
    {Tag, Val} -> Val;  
    {A, X} ->  
      A ! F(X),  
      go(A, Tag)  
  end.
```

# Timeouts

18

```
receive
  Message1 [when
    Actions1 ;
  Message2 [when
    Actions2 ;
  ...
after
  TimeOutExpr ->
    ActionsT
end
```

```
get_event() ->
  receive
    {mouse, click} ->
      receive
        {mouse, click} ->
          double_click
        after double_click_interval()
      -> single_click
  end ...
end.
```

- Developed in 2007 at Google
  - open source
- Key features:
  - compiled, statically-typed
  - garbage collected
  - C-like syntax
  - built-in concurrency
    - encourages message-passing

# Concurrency

20

## - Goroutine:

- ▶ a function that executes concurrently with other goroutines in the same address space
  - acts as a lightweight user-space thread

## - Channel:

- ▶ generalization of Unix pipes
- ▶ similar to channels in CSP

## - Coordination primarily via channels; mutexes, locks, semaphores much less common

## - Unlike Erlang, Go assumes shared address space

# Goroutine

21

```
package main

import (
    "fmt"
    "time"
)

func f(from string) {
    for i := 0; i < 3; i++ {
        fmt.Println(from, ":", i)
    }
}

func main() {
    f("direct")

    go f("goroutine")

    go func(msg string) {
        fmt.Println(msg)
    }("going")

    time.Sleep(time.Second)
    fmt.Println("done")
}
```

Establishes an asynchronous thread of control

```
$ go run goroutines.go
direct : 0
direct : 1
direct : 2
goroutine : 0
going
goroutine : 1
goroutine : 2
done
```

# Channels

22

```
package main

import "fmt"

func main() {
    messages := make(chan string)

    go func() { messages <- "ping" }()

    msg := <-messages
    fmt.Println(msg)
}
```

sends a message onto a channel

receives a message from a channel

# Buffering

23

```
package main

import "fmt"

func main() {

    messages := make(chan string, 2)

    messages <- "buffered"
    messages <- "channel"

    fmt.Println(<-messages)
    fmt.Println(<-messages)
}
```

Allows sends to be asynchronous

# Channel Synchronization

24

```
package main

import (
    "fmt"
    "time"
)

func worker(done chan bool) {
    fmt.Print("working...")
    time.Sleep(time.Second)
    fmt.Println("done")

    done <- true
}

func main() {
    done := make(chan bool, 1)
    go worker(done)

    <-done
}
```

Blocks until acknowledgement  
received from worker.

# Directionality

25

```
package main

import "fmt"

func ping(pings chan<- string, msg string) {
    pings <- msg
}

func pong(pings <-chan string, pongs chan<- string) {
    msg := <-pings
    pongs <- msg
}

func main() {
    pings := make(chan string, 1)
    pongs := make(chan string, 1)
    ping(pings, "passed message")
    pong(pings, pongs)
    fmt.Println(<-pongs)
}
```

Channel actions (sends, receives, or both) recorded as part of its type.

Ping can only send messages on chan

Pong can only receive messages on channel pings and can only send messages on channel pongs

# Select

26

```
package main

import (
    "fmt"
    "time"
)

func main() {

    c1 := make(chan string)
    c2 := make(chan string)

    go func() {
        time.Sleep(1 * time.Second)
        c1 <- "one"
    }()
    go func() {
        time.Sleep(2 * time.Second)
        c2 <- "two"
    }()

    for i := 0; i < 2; i++ {
        select {
            case msg1 := <-c1:
                fmt.Println("received", msg1)
            case msg2 := <-c2:
                fmt.Println("received", msg2)
            }
        }
    }
}
```

```
$ time go run select.go
received one
received two

real    0m2.245s
```

**Sleeps on both goroutines execute concurrently**

# Example

27

## - Web crawler

- mask latency of network communication
- access pages in parallel
- send requests asynchronously
  - display results on receipt

```
func main() {  
    start := time.Now()  
    for _, site := range os.Args[1:] {  
        count("http://" + site)  
    }  
    fmt.Printf("%.2fs total\n", time.Since(start).Seconds())  
}
```

```
func count(url string) {  
    start := time.Now()  
    r, err := http.Get(url)  
    if err != nil {  
        fmt.Printf("%s: %s\n", url, err)  
        return  
    }  
    n, _ := io.Copy(ioutil.Discard, r.Body)  
    r.Body.Close()  
    dt := time.Since(start).Seconds()  
    fmt.Printf("%s %d [%.2fs]\n", url, n, dt)  
}
```

*No parallelism*

# Example using goroutines

28

```
func main() {  
    start := time.Now()  
    for _, site := range os.Args[1:] {  
        count("http://" + site)  
    }  
    fmt.Printf("%.2fs total\n", time.Since(start).Seconds())  
}
```

```
func count(url string) {  
    start := time.Now()  
    r, err := http.Get(url)  
    if err != nil {  
        fmt.Printf("%s: %s\n", url, err)  
        return  
    }  
    n, _ := io.Copy(ioutil.Discard, r.Body)  
    r.Body.Close()  
    dt := time.Since(start).Seconds()  
    fmt.Printf("%s %d [%.2fs]\n", url, n, dt)  
}
```
