

# **CS 40700 Software Engineering Senior Project**

Software Engineering students learn the Scrum Agile software engineering approach in CS 30700

CS 40700 is our capstone course

Students work in 4-6 person teams on their final project as college students

Important goal of the senior project is that they work well as a team and make professional presentations at each of their Sprint reviews

Teams typically produce excellent products using things they have been taught throughout their four years in CS and even learn how to use tools that they have not been taught in class

# CS 40700 Software Engineering Senior Project

Examples:

**AWS** (Amazon Web Services cloud computing platforms)

**DigitalOcean** (cloud services to deploy and scale applications)

**Bootstrap** (open-source front-end Web framework)

**Django** (Python-based web framework)

**Angular** (TypeScript-based web application framework)

**Node.js** (open-source, cross-platform JavaScript run-time environment)

**React** (JavaScript library for building user interfaces)

**Ajax** (create asynchronous web applications)

**Firebase** (web application development platform)

**PHP** (general-purpose language designed for web development)

**Symfony** (PHP web application framework)

**Cascading Style Sheets** (language for describing the presentation of a document)

**Restful APIs** (provide interoperability between computer systems)

**mySQL** (open source relational database management system)

**PostgreSQL** (open source relational database management system)

**MongoDB** (NoSQL database program)

**Electron** (GitHub's framework for development of desktop GUI applications)

**Google Cloud Speech-to-Text API**

**ONNX** (Open Neural Network Exchange for interoperable AI models)

# **CS 40700 Software Engineering Senior Project**

**Team DZA, Fall 2018**

Ben Maxfield, Brian Duffy, Adam Johnston,  
Terry Lam, Christian Lock, Jalen Smith

Project Coordinator Alina Nesen

Faculty Project Owner Prof. Petros Drineas

# DZA

## API Data Version History

A software engineering senior project

# What is an API?

Application

A set of functions or procedures used to access and communicate with other applications and services.

Programming

Interface

-----

We use **HTTP requests** as our main method of communication when requesting resources from different APIs.

# What is an HTTP Request?

## Hypertext Transfer Protocol

HTTP is a protocol that defines how message or request for a resource is defined.

-----  
Contain a **method**, a **URL**, and **parameters**

**GET**

**[https://www.googleapis.com/gmail/v1/users/me/messages?q="in:sent after:2014/01/01 before:2014/01/30"](https://www.googleapis.com/gmail/v1/users/me/messages?q=)**

\*An HTTP request to Google's Gmail API, which is requesting all messages sent between two dates

# How DZA works

1. Users create a “flow” of API requests, and feed the responses of one request into the next.
2. These flows are executed on our server and the resulting response is saved.
3. Responses can be compared to previously executed flows to look for differences.
4. Depending on the user’s needs, flows can be executed on a regular schedule

```
1 {
2   "body" : {
3     "object1" : {
4       "attribute1" : "value1",
5       "attribute2" : "value2"
6     },
7     "object2" : {
8       "attribute1" : "value1"
9     },
10    "resources" : [
11      "object1",
12      "object2"
13    ]
14  }
15 }
16
```

Request Flow A

## DZA is *Versatile*

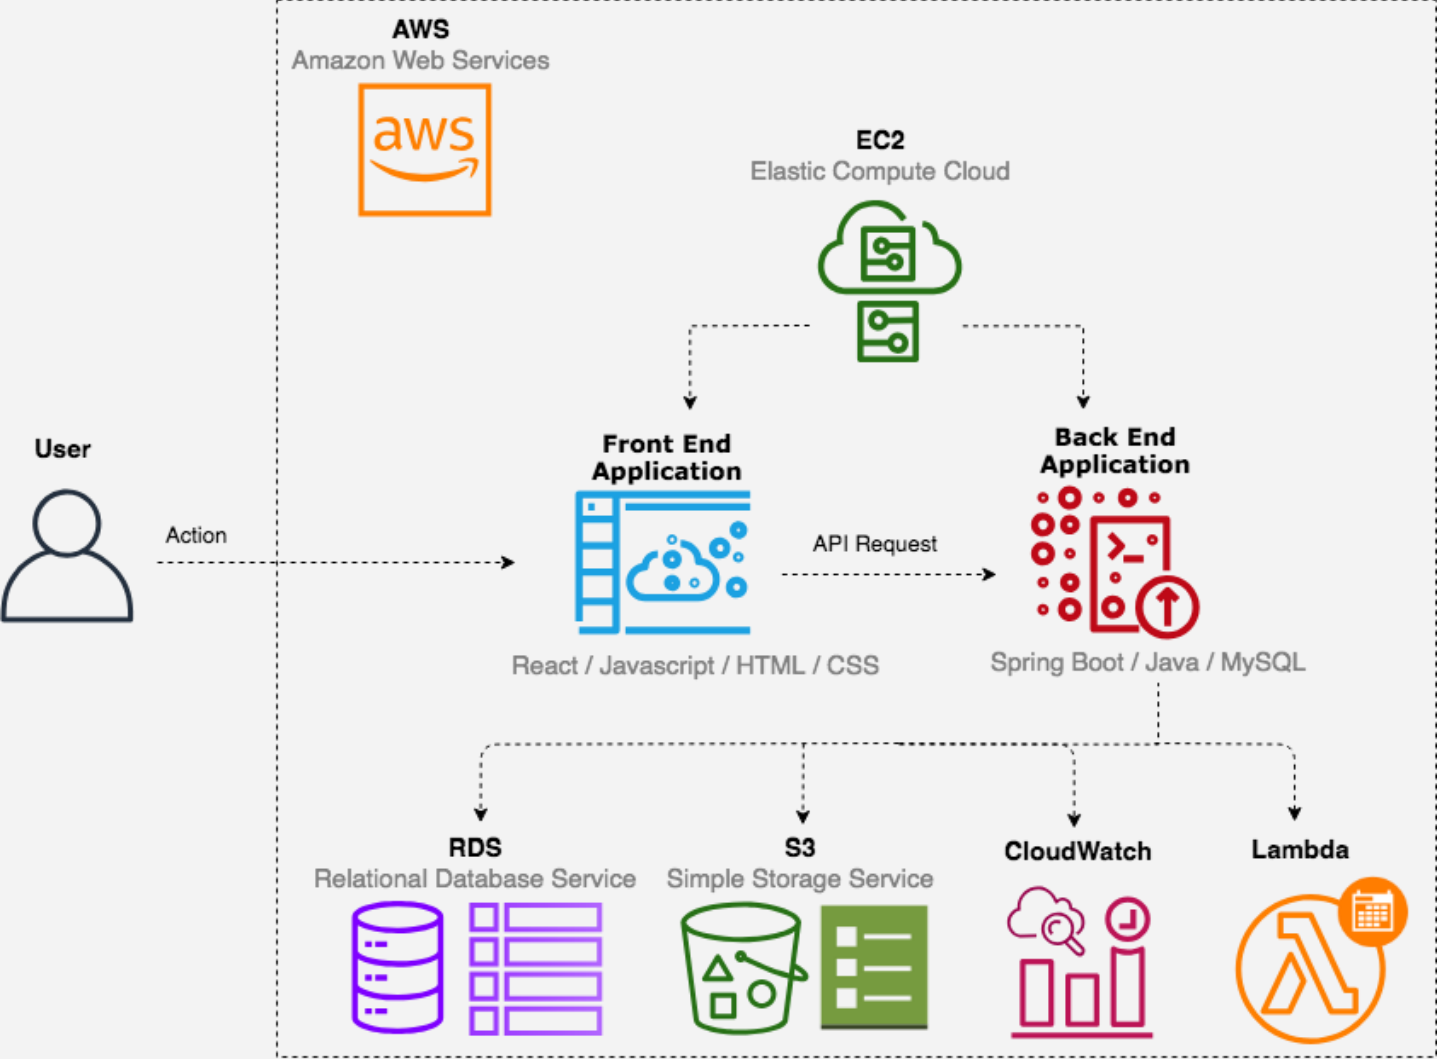

DZA fills a service gap for developers

- Scripting - makes it easy to automate actions
- Operations - tracks changes to production data
- Testing - logs responses to test requests
