

# Camera Models

CS535

Daniel G. Aliaga  
Department of Computer Science  
Purdue University

# Our (3D) World...

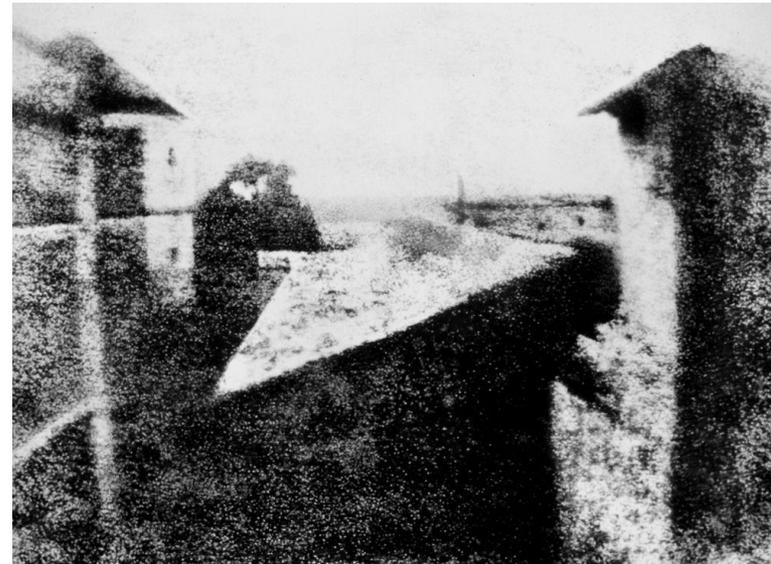

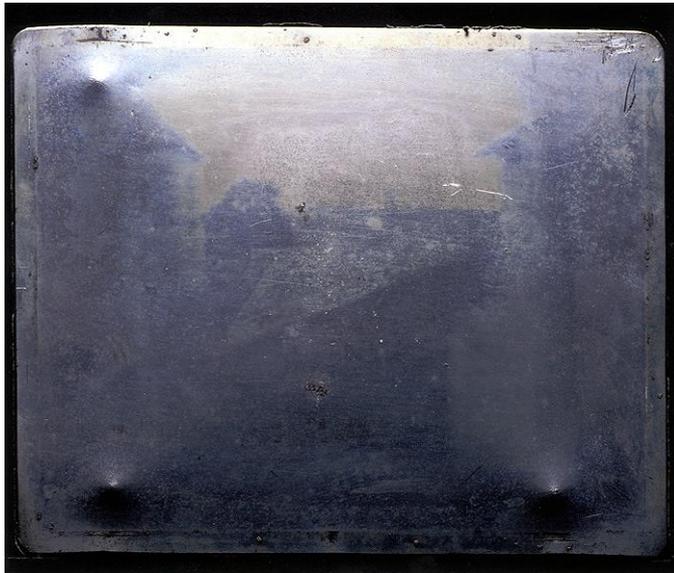

# Cameras

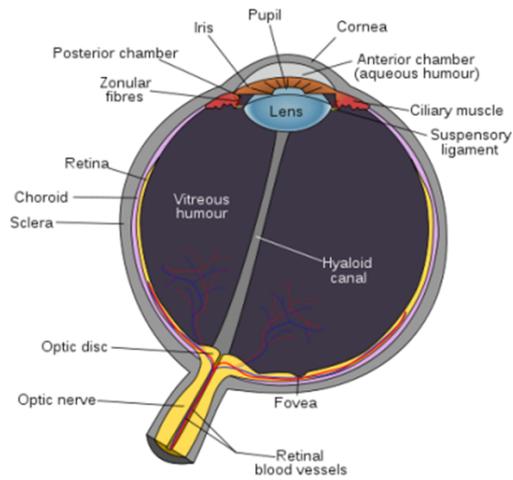

- First photograph due to Nicéphore Niépce (1826):

- Heliography: pewter covered with “Bitumen of Judea” (derived from crude oil) and then areas exposed to sunlight resisted dissolution in oil of lavender and petroleum

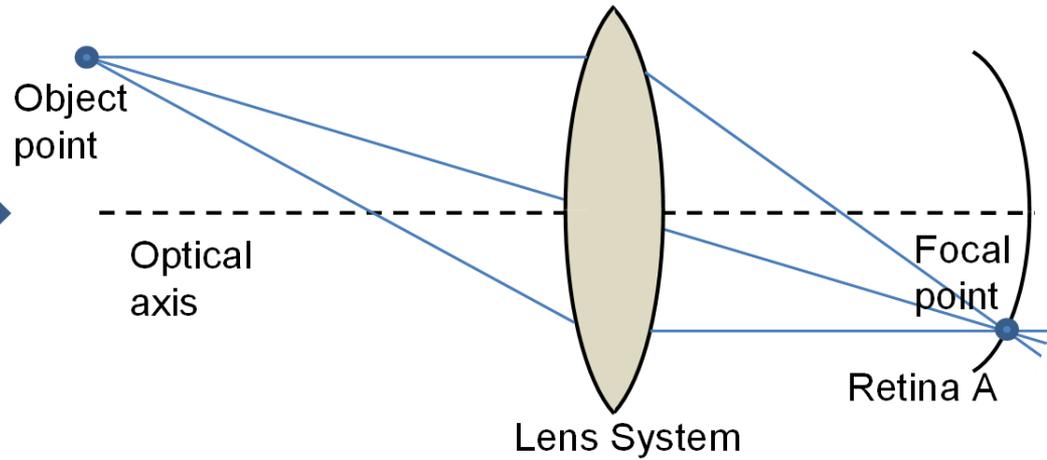

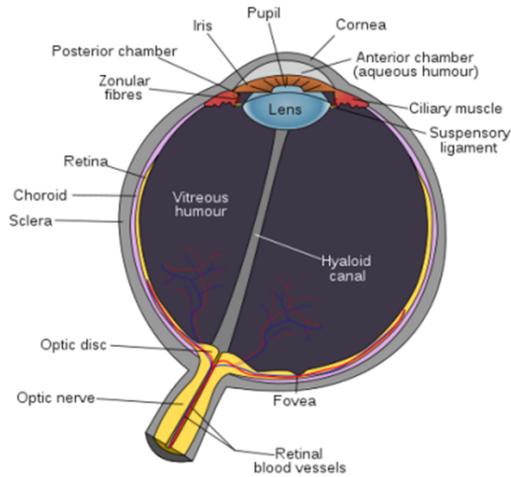

# Human Eye

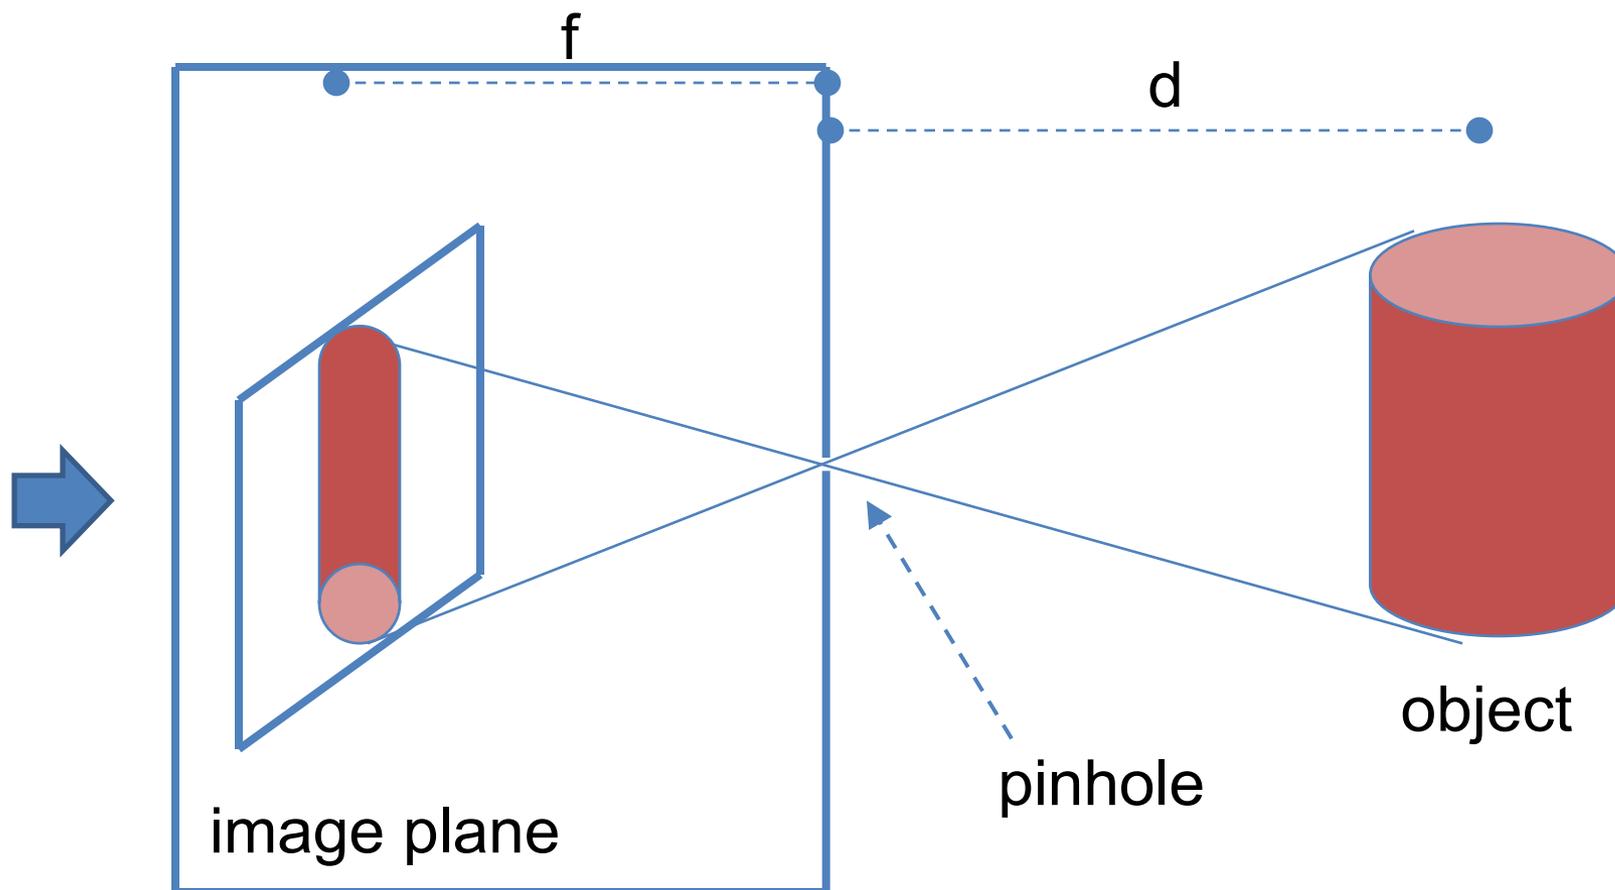

# Thin Lens System

# Pinhole Camera Model

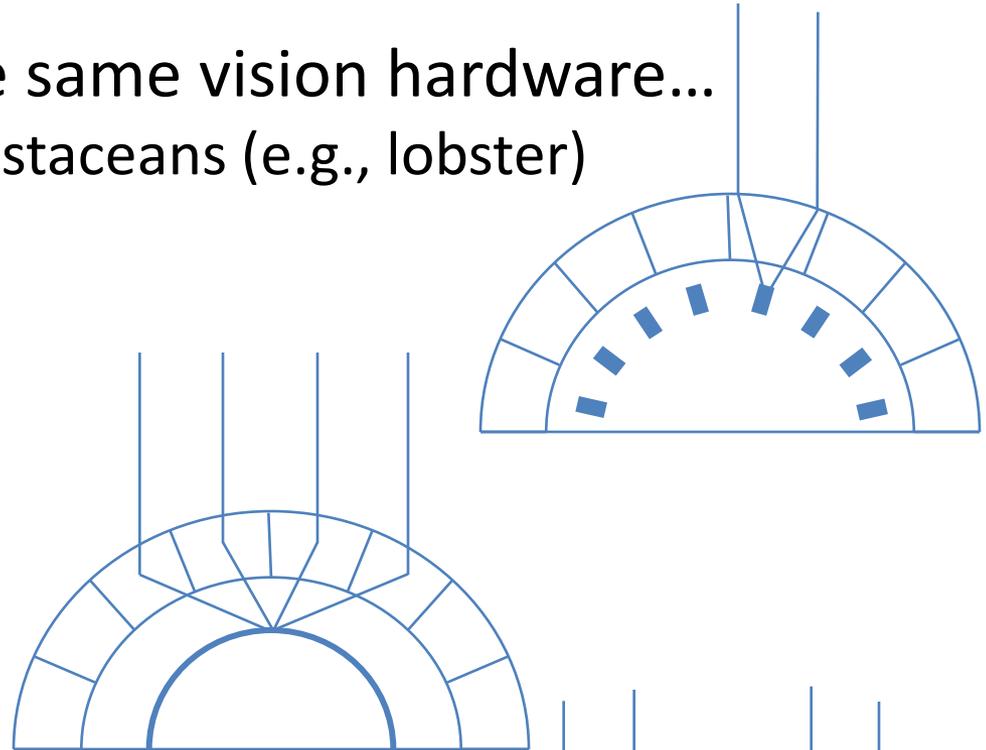

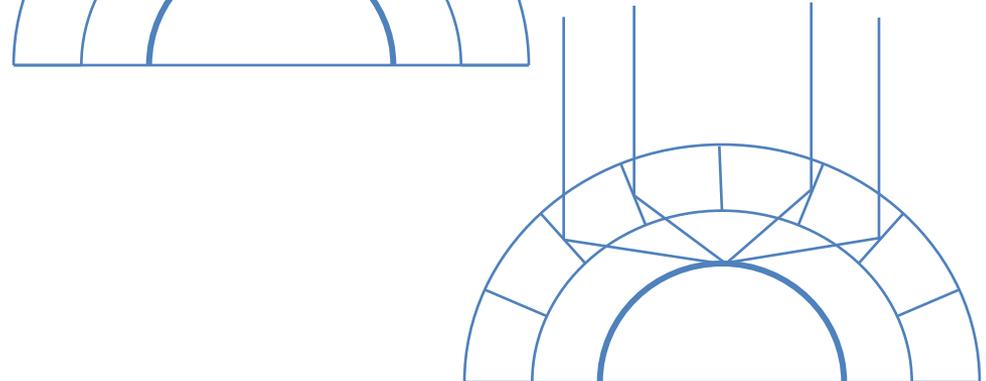

# Biology 101

- Not all animals have the same vision hardware...
  - e.g., certain insects, crustaceans (e.g., lobster)

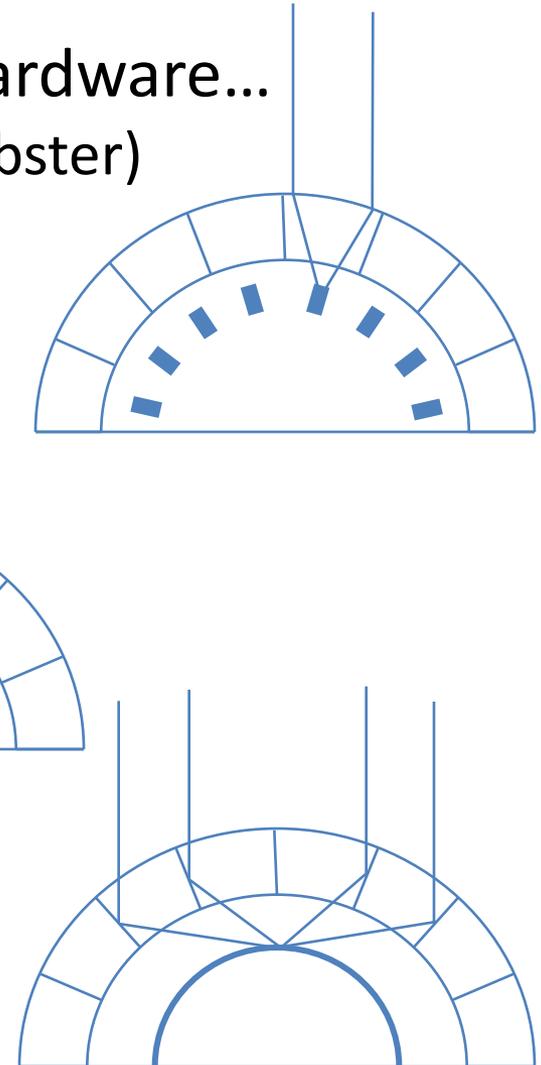

- Diurnal Insect Vision

- Nocturnal Insect Vision

- Crustacean Vision

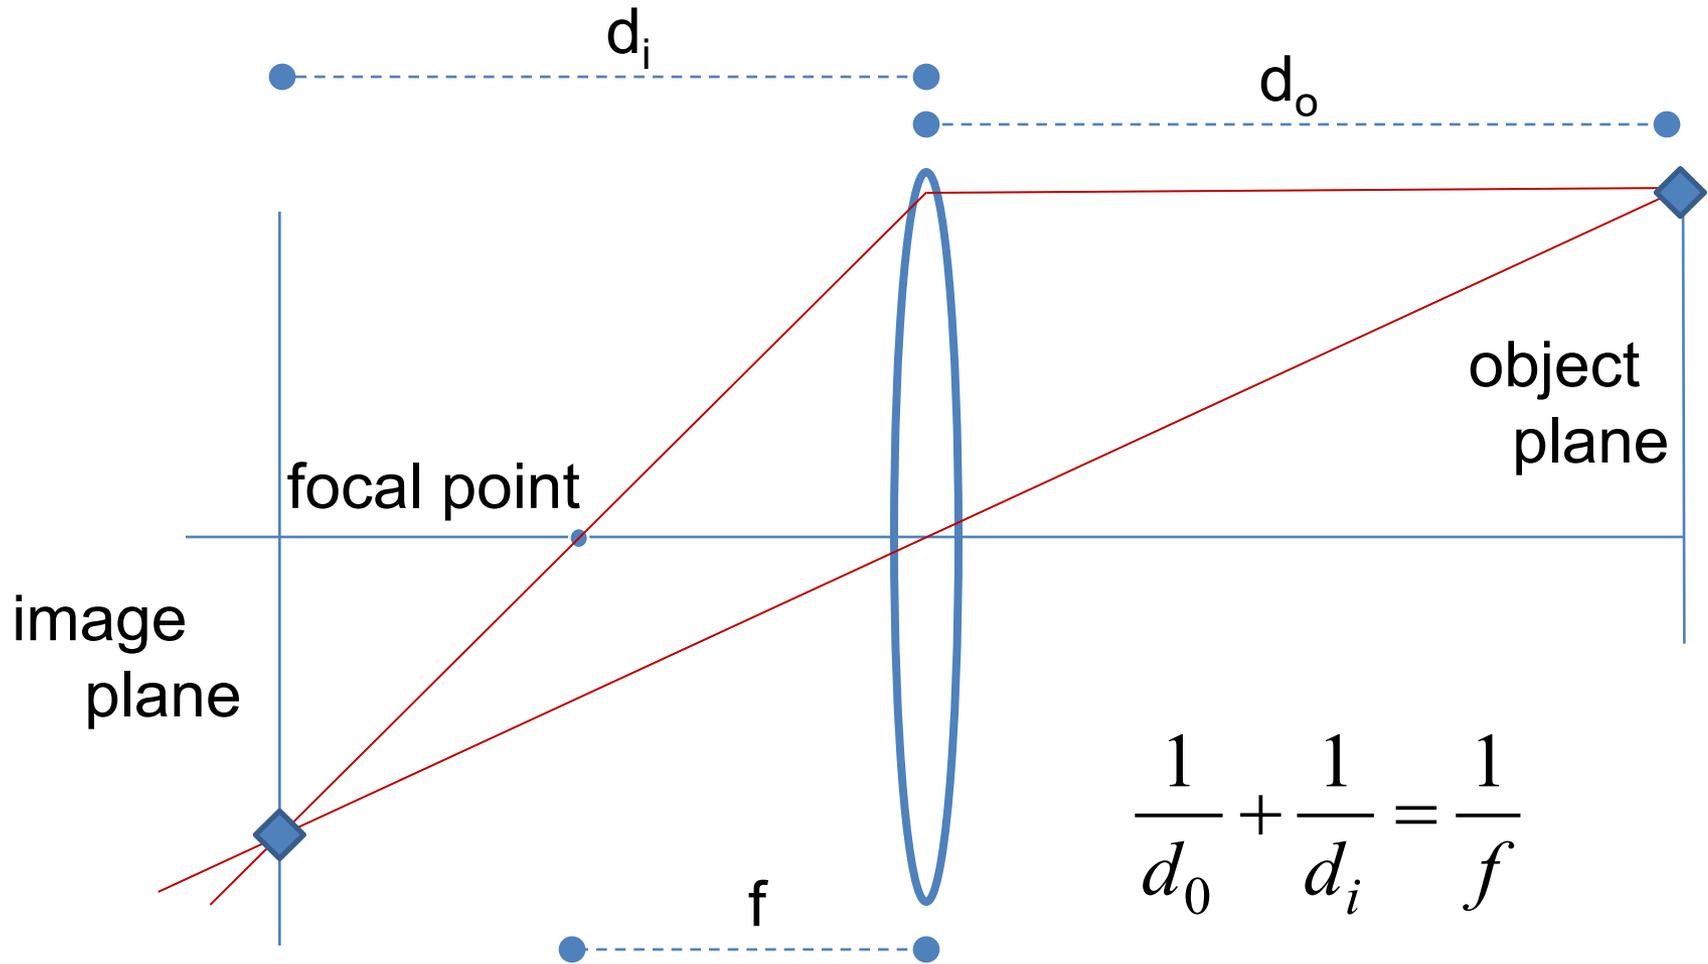

# Optics: Terminology

- Dioptric
  - All elements are refractive (lenses)
- Catoptric
  - All elements are reflective (mirrors)
- Catadioptric
  - Elements are refractive and reflective (mirrors + lenses)

# Thin Lens Equation

# Cool demo

- <https://phet.colorado.edu/en/simulations/geometric-optics>

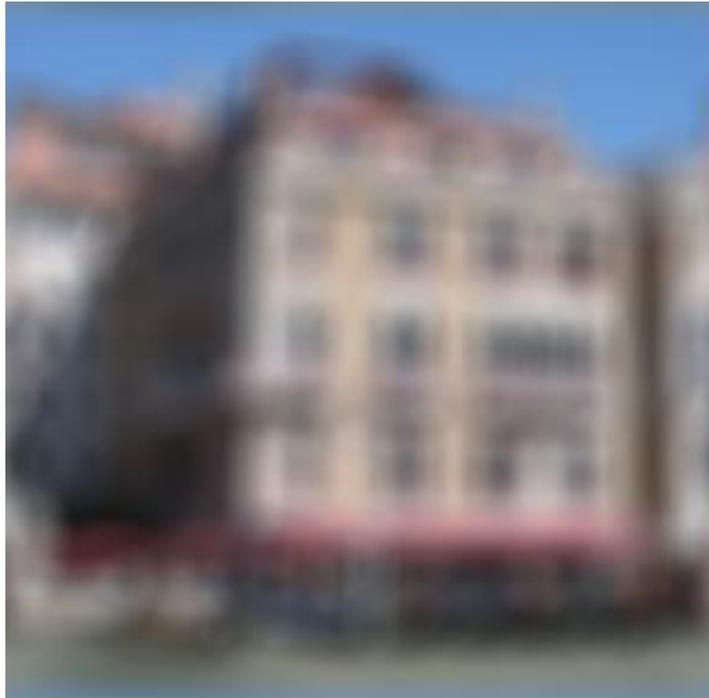

# Thin Lens Equation

- What happens if image plane is not at the focal point (distance)?

# Digression: Deblurring

# Digression: Deblurring

[Chan et al., IEEE IP 2011]

# Digression: Synthetic Focusing

- Ray tracing:

- Lightfield:

- [http://lightfield.stanford.edu/aperture.swf?lightfield=data/chess\\_lf/preview.zip&zoom=1](http://lightfield.stanford.edu/aperture.swf?lightfield=data/chess_lf/preview.zip&zoom=1)

- Lytro Camera:

- [http://lightfield.stanford.edu/aperture.swf?lightfield=data/chess\\_lf/preview.zip&zoom=1](http://lightfield.stanford.edu/aperture.swf?lightfield=data/chess_lf/preview.zip&zoom=1)

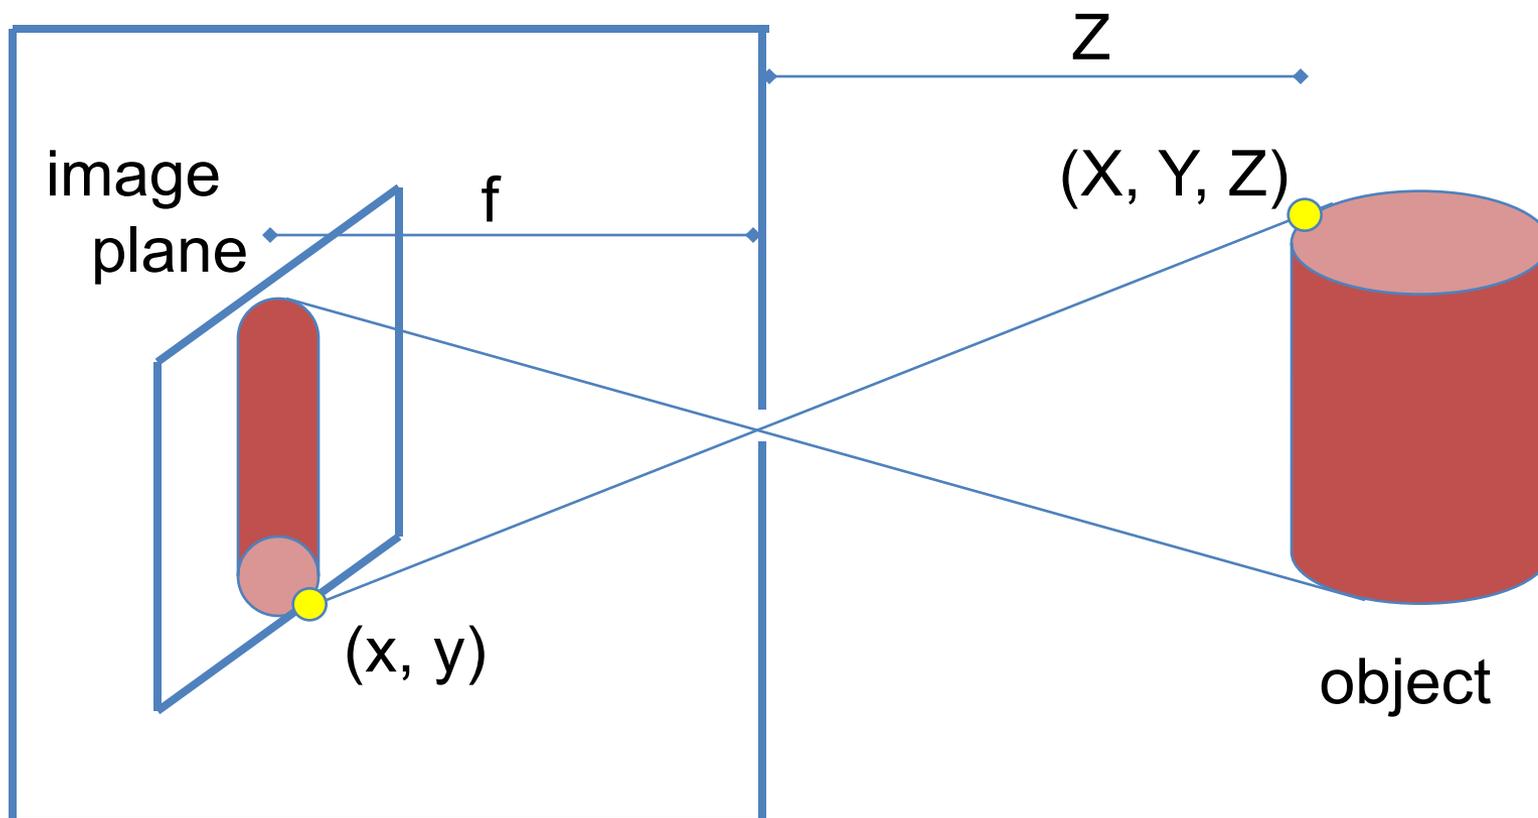

# Digression: Non-Pinhole Camera Models...

- Why restrict the camera to a pinhole camera model?
  - Aperture is large: lightfields/lumigraphs
  - Multi-perspective imaging
  - Sample-based camera
  - Tailored camera designs
    - Occlusion-resistant cameras (kinda...)
    - Graph cameras
    - and more!

**[later will see slides of other camera models...]**

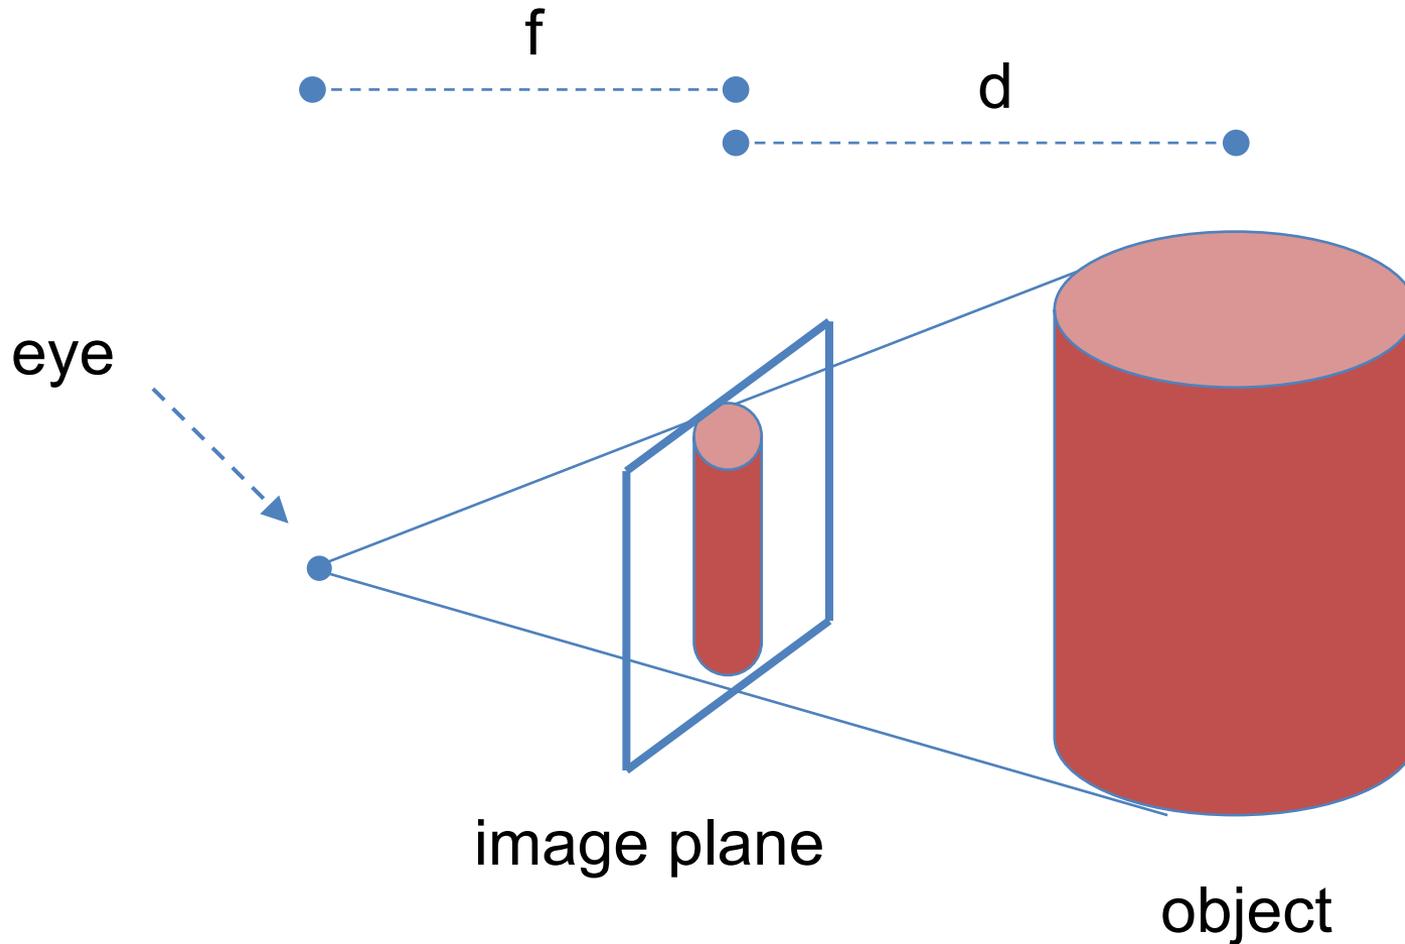

# Pinhole Camera Model

$$x = f \frac{X}{Z}$$

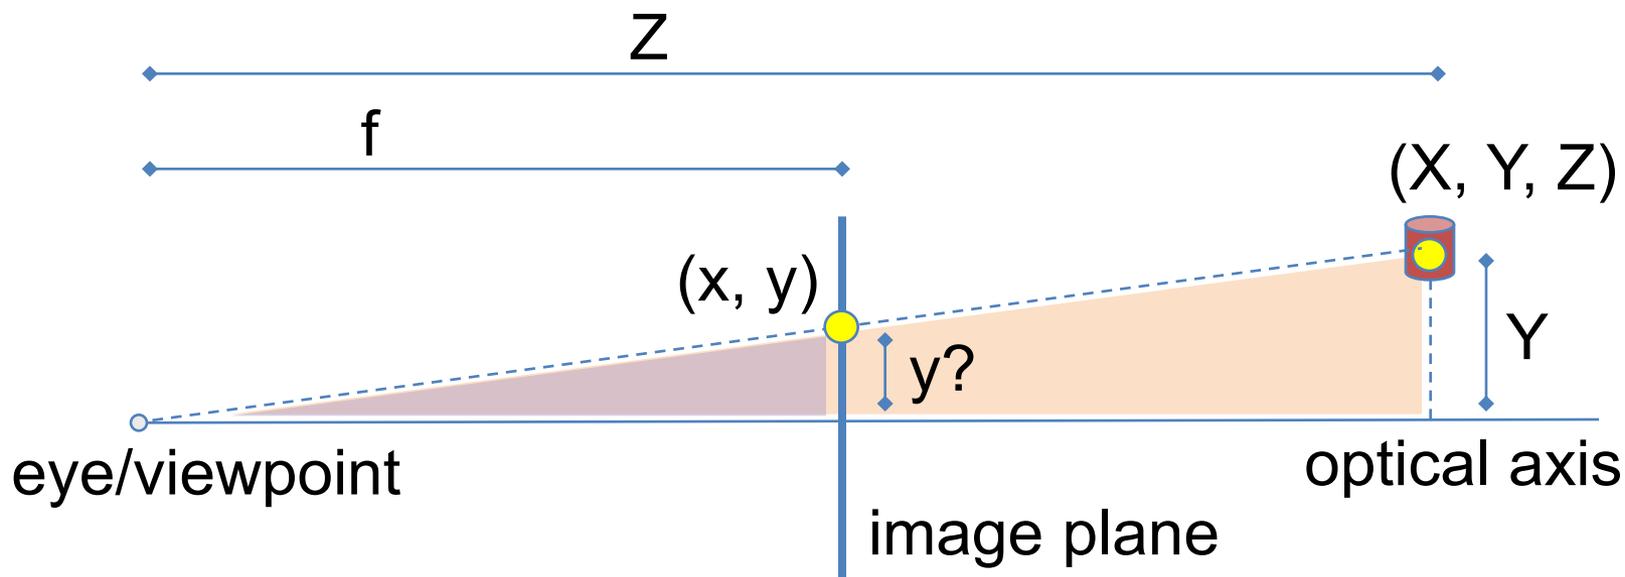

$$y = f \frac{Y}{Z}$$

# “Computer Graphics” Pinhole Camera Model

# 3D Perspective Projection

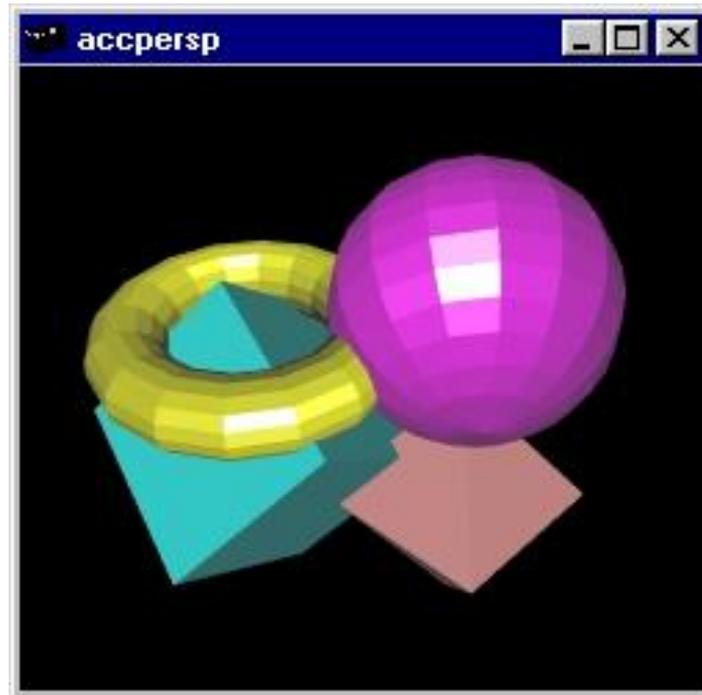

$$\frac{y}{f} = \frac{Y}{\bar{Z}}$$

$$y = f \frac{Y}{\bar{Z}} \quad \& \quad x = f \frac{X}{\bar{Z}}$$

# Example OpenGL Rendering

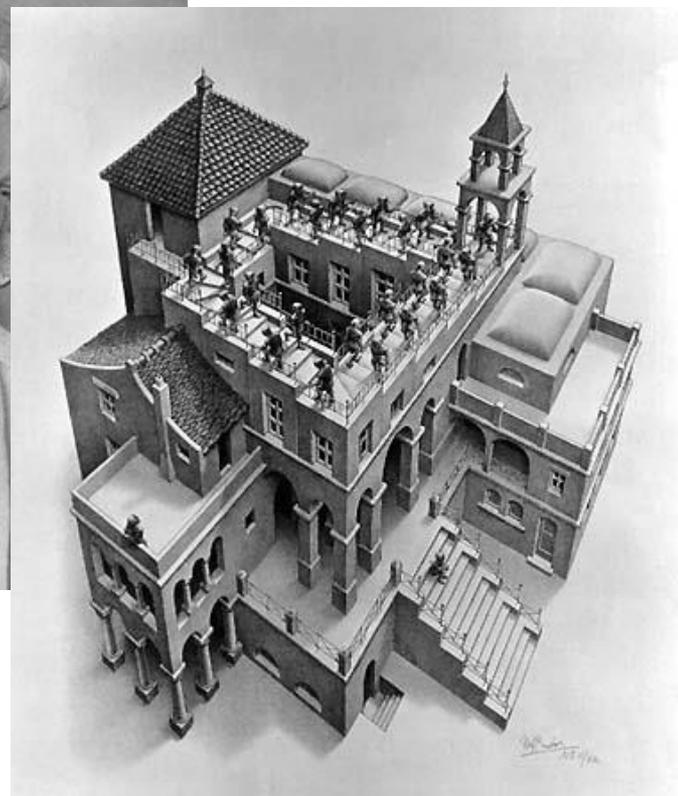

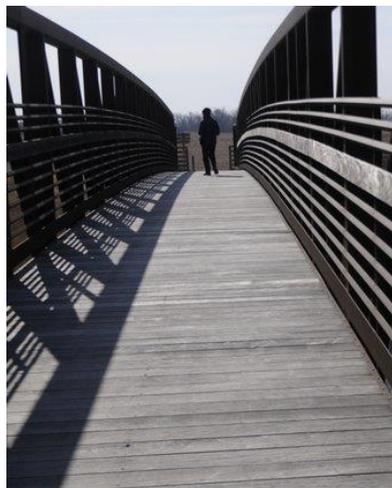

- Perspective is “mathematically” accurate...

# (3D) Perception

- There is lot to it...

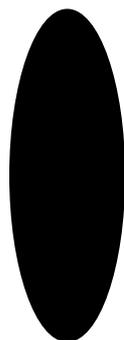

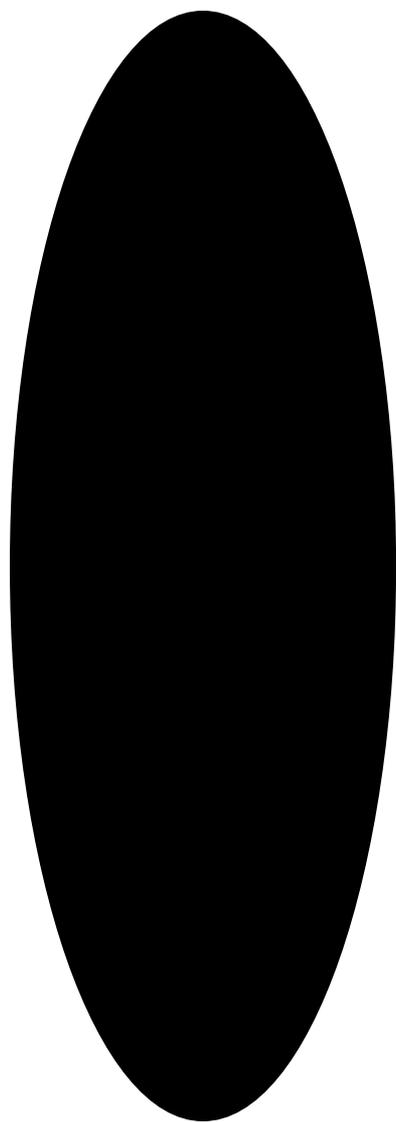

# (3D) Perception

- There is lot more to it...

# Perception

- Size-distance relationship
  - Same size object at two distances...

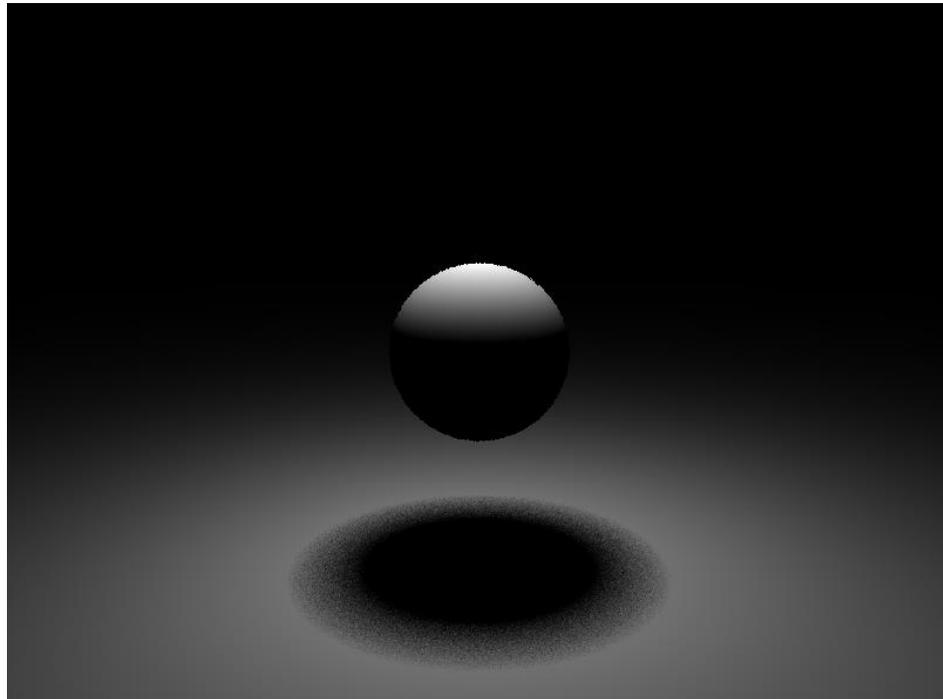

# Perception

- Importance of ground plane, shadows...

# Perception

- Alto Relief

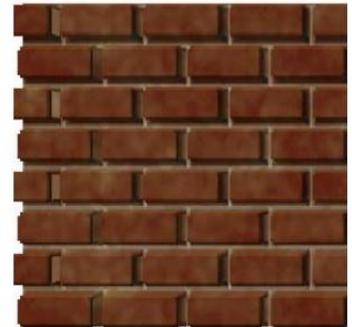

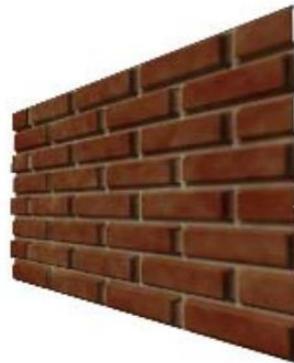

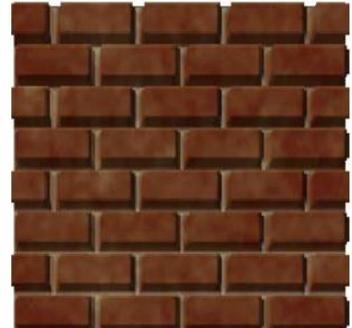

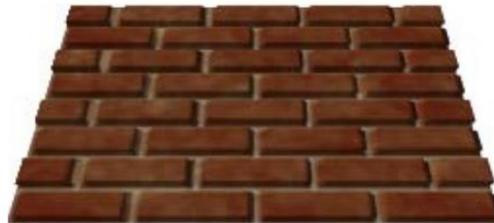

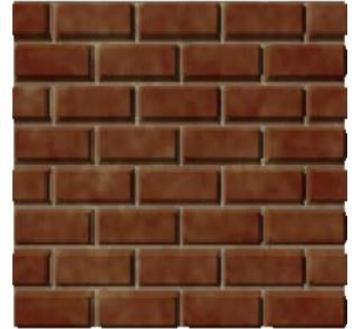

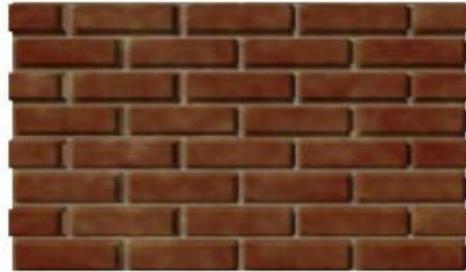

- Sunken Relief

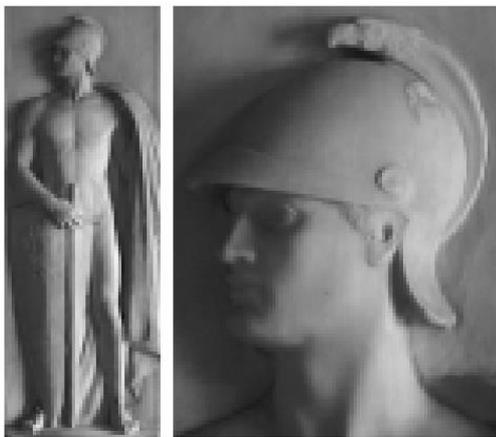

# (Relief Images)

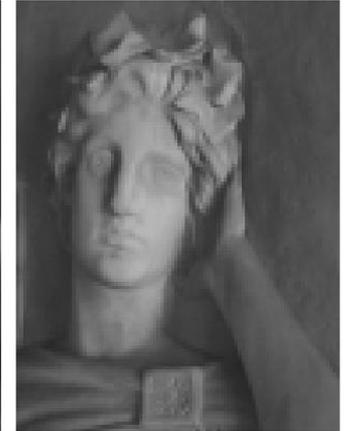

- We will see this type of things later...

# Perception: Bas-Relief

# Perception: Bas-Relief

# Perception: Bas Relief Ambiguity

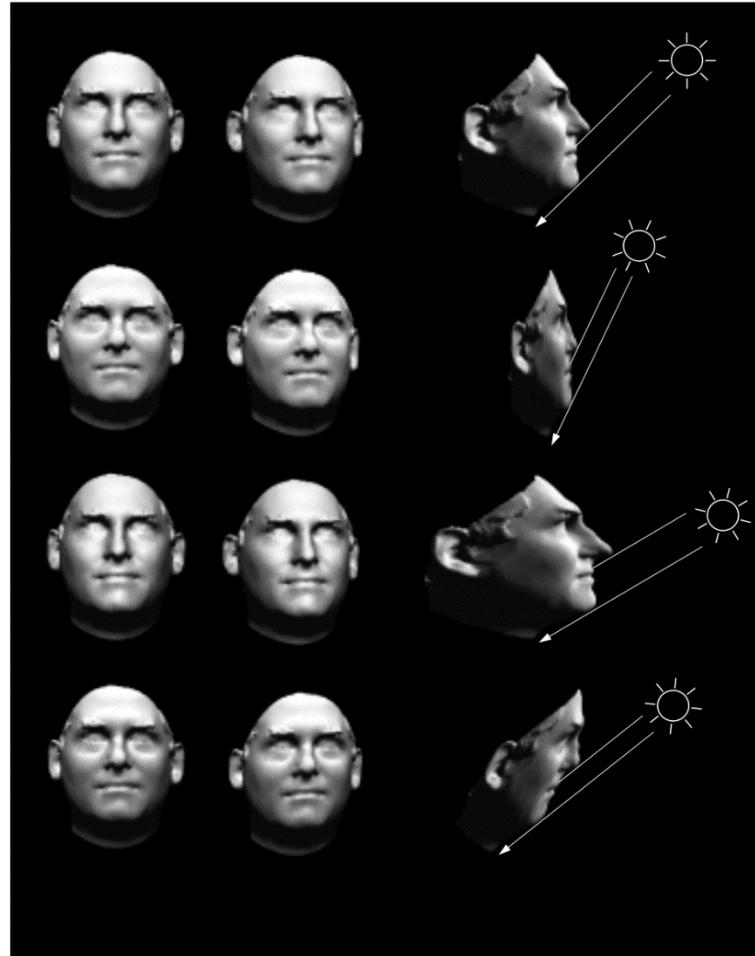

$$NL^T = C$$

or

$$NRR^T L^T = C$$

$$NGG^{-1} L^T = C$$

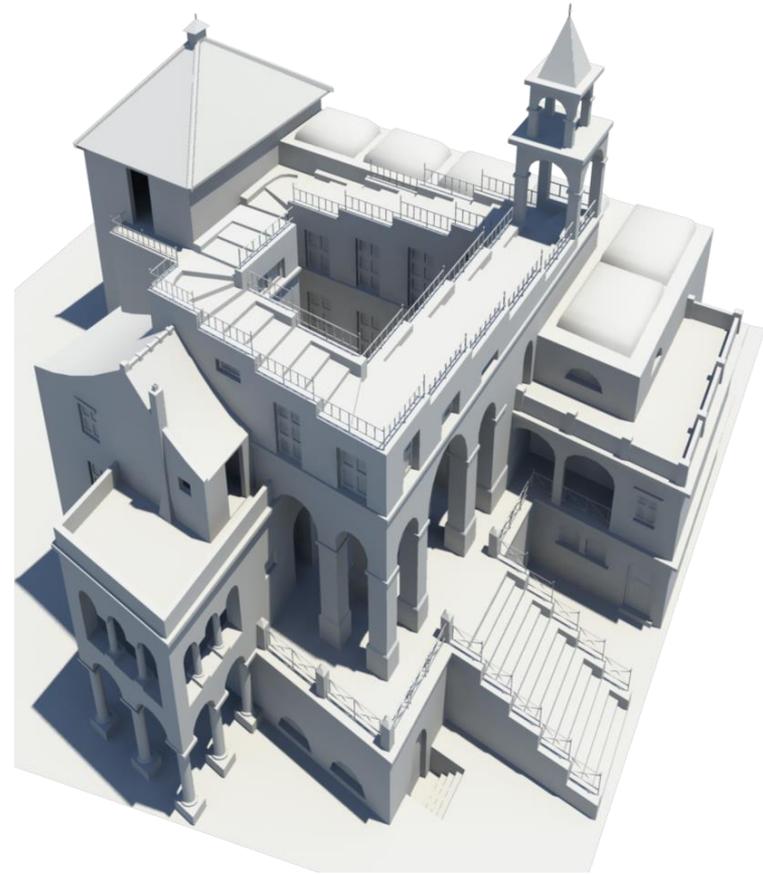

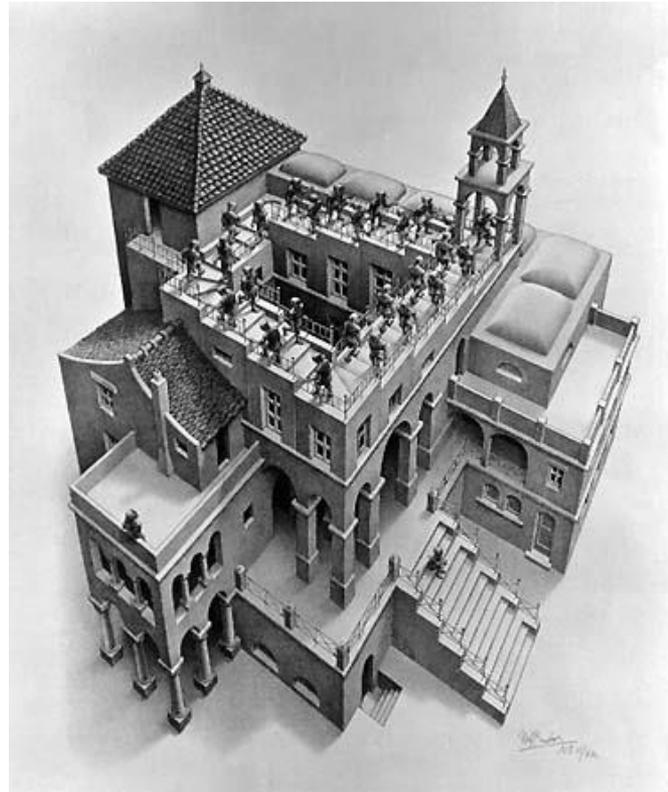

??

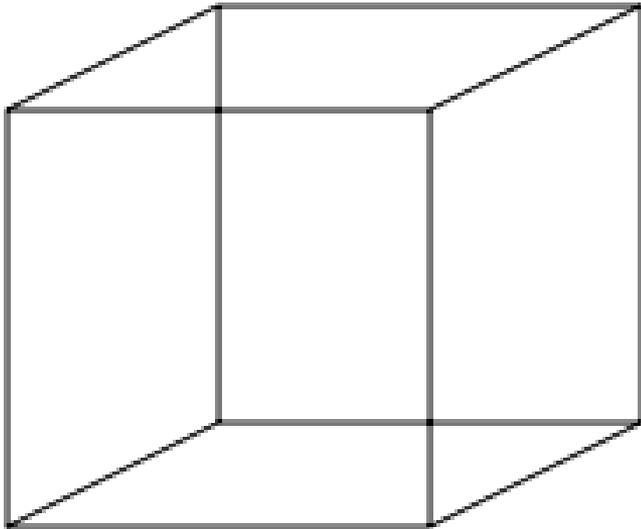

# Perception: Inconsistencies

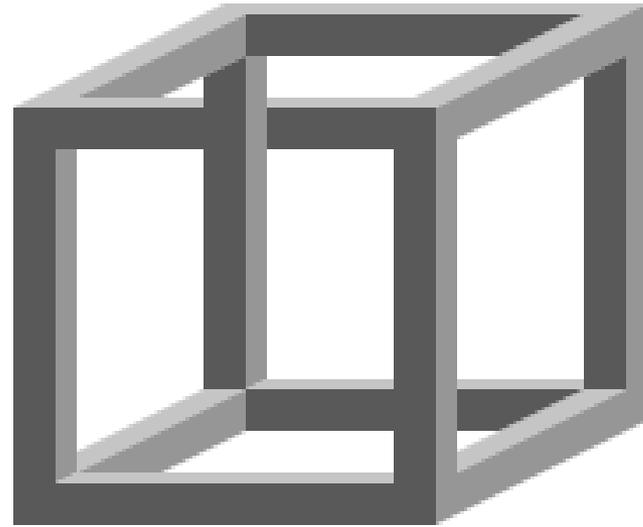

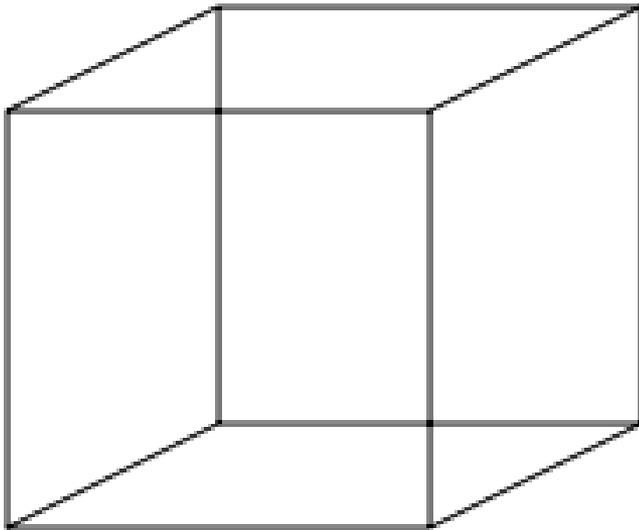

- Escher

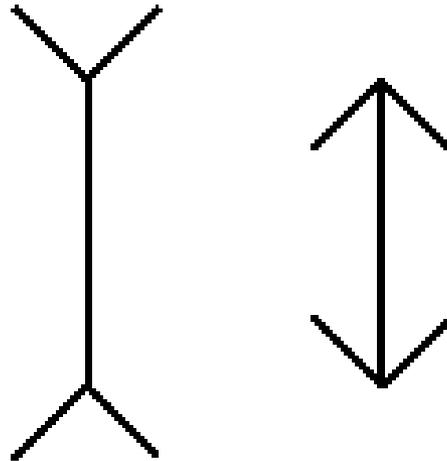

# Perception: Necker Cube

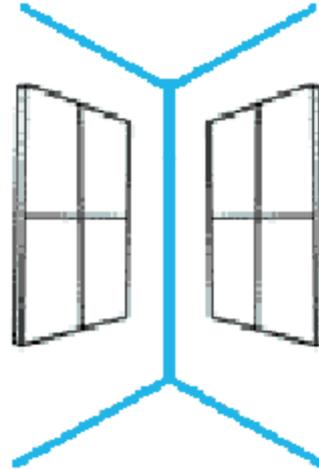

# Perception: Necker Cube

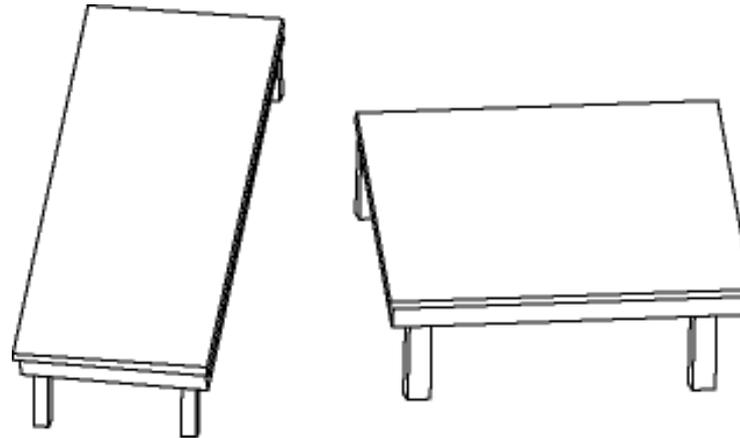

# Perception: Muller-Lyer Illusion

# Perception: Muller-Lyer Illusion

# Perception: Muller-Lyer Illusion

# Perspective Camera Parameters

- Intrinsic/Internal

- Focal length

$$f$$

- Principal point (center)

$$p_x, p_y$$

- Pixel size

$$s_x, s_y$$

- (Distortion coefficients)

$$k_1, \dots$$

- Extrinsic/External

- Rotation

$$\phi, \varphi, \psi$$

- Translation

$$t_x, t_y, t_z$$

# Perspective Camera Parameters

- Intrinsic/Internal

- Focal length

$f$

- Principal point (center)

(=middle of image)

- Pixel size

(=1, irrelevant)

- (Distortion coefficients)

(=0, assuming no bugs 😊)

- Extrinsic/External

- Rotation

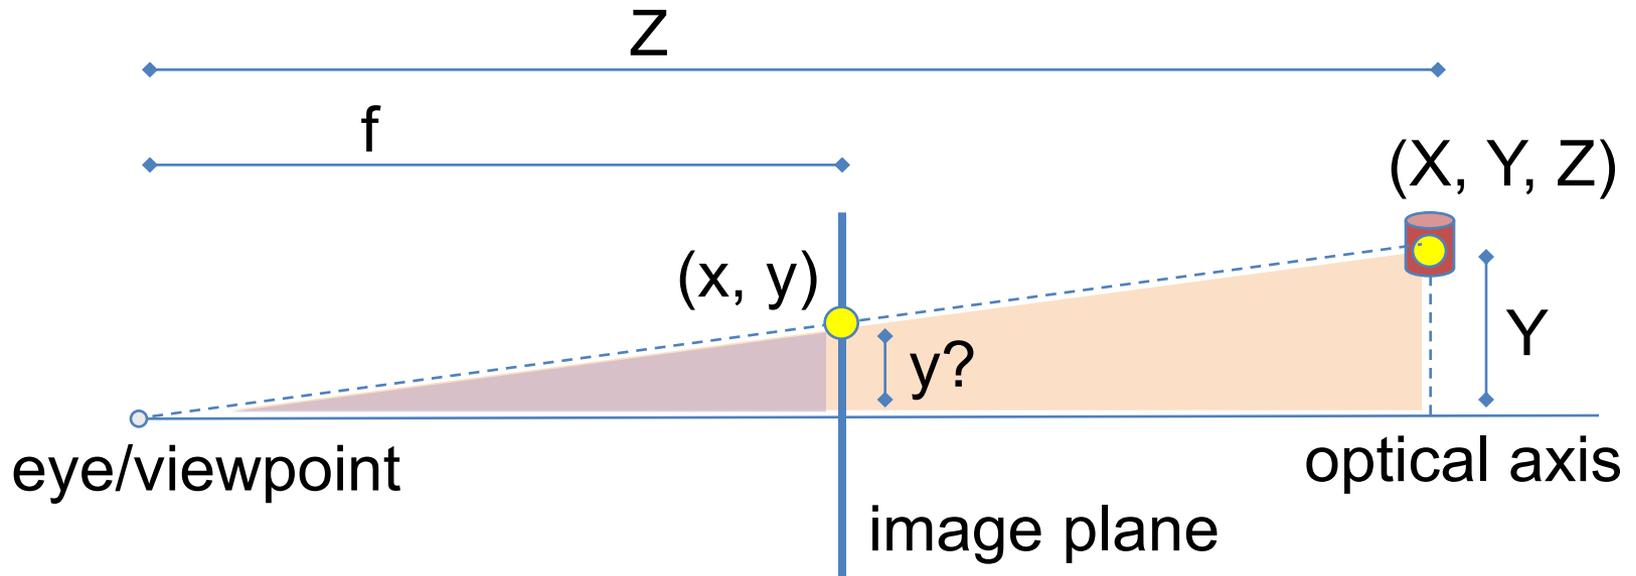

$\phi, \varphi, \psi$

- Translation

$t_x, t_y, t_z$

# Recall: 3D Perspective Projection

$$\frac{y}{f} = \frac{Y}{Z}$$

$$y = f \frac{Y}{Z} \quad \& \quad x = f \frac{X}{Z}$$

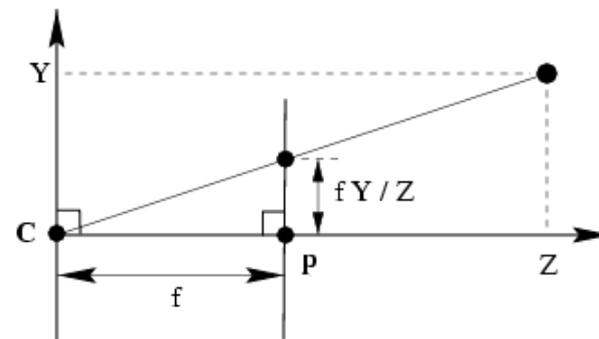

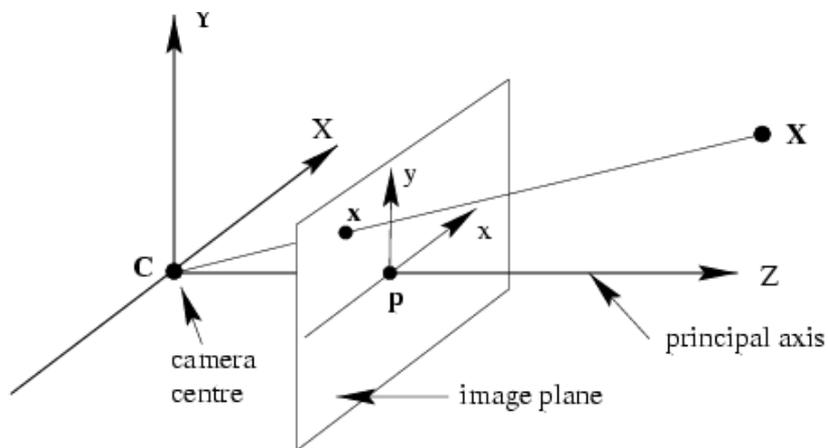

# Matrix Encoding

- How do we put the perspective divide process into the matrix pipeline?

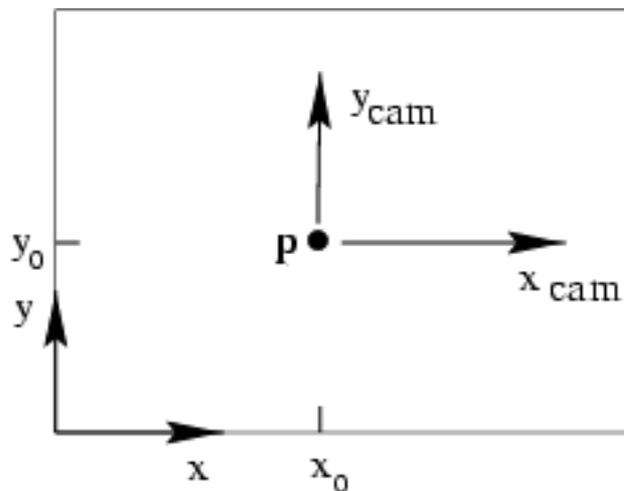

# Focal Length

$$\begin{pmatrix} x \\ y \end{pmatrix} = \begin{pmatrix} fX/Z \\ fY/Z \end{pmatrix} \leftarrow \begin{pmatrix} fX \\ fY \\ Z \end{pmatrix} = \begin{bmatrix} & & & \\ & & & \\ & & & \\ & & & \end{bmatrix} \begin{pmatrix} X \\ Y \\ Z \\ 1 \end{pmatrix}$$

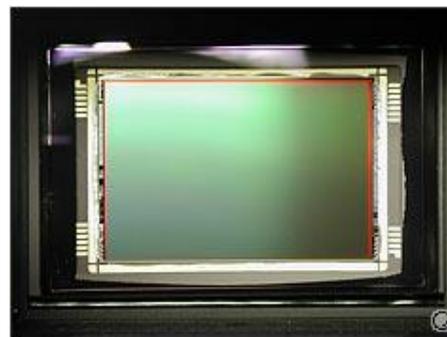

# Principal Point

$$\begin{pmatrix} x_0 \\ y_0 \end{pmatrix} \leftarrow \begin{pmatrix} fX + Zp_x \\ fY + Zp_y \\ Z \end{pmatrix} = \begin{bmatrix} X \\ Y \\ Z \\ 1 \end{bmatrix}$$

# CCD Camera: Pixel Size

$$P = \begin{bmatrix} f & 0 & p_x & 0 \\ 0 & f & p_y & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix}$$

In graphics, often

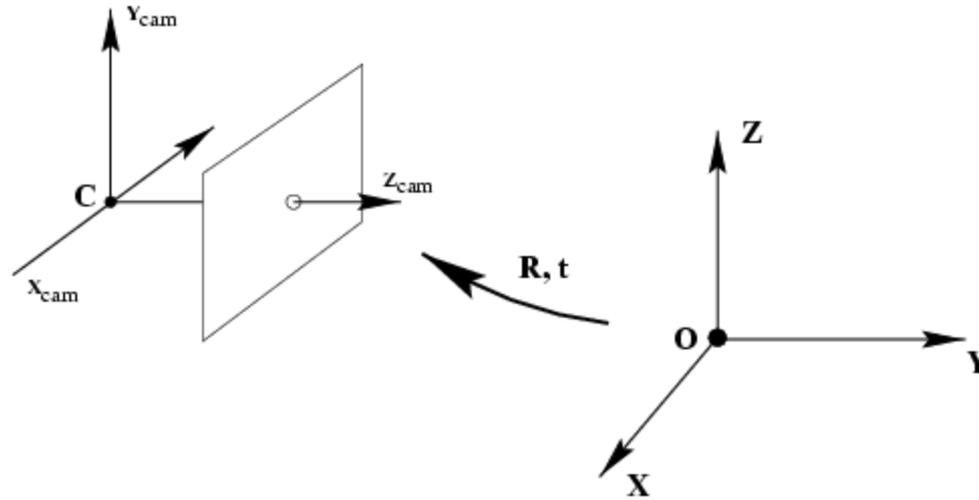

$$\begin{aligned} s_x &= s_y = 1 \\ p_x &= p_y = 0 \end{aligned}$$

$$P = \begin{bmatrix} \alpha_x & 0 & p_x & 0 \\ 0 & \alpha_y & p_y & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix}$$

Projection matrix

# Translation & Rotation

$$\left. \begin{aligned} \tilde{x}_c &= R(\tilde{X} - C) \\ \tilde{x}_c &= R\tilde{X} - RC \\ &\quad \downarrow \\ &\quad -t \end{aligned} \right\} \tilde{x}_c = \begin{bmatrix} R & t \\ 0 & 1 \end{bmatrix} \begin{pmatrix} X \\ Y \\ Z \\ 1 \end{pmatrix}$$

$$R = R_x R_y R_z$$

3x3 rotation matrices

$$t = \begin{bmatrix} t_x & t_y & t_z \end{bmatrix}^T$$

translation vector

World-to-camera matrix  $M$

# Perspective Projection Process

- Given  $\tilde{X} = \begin{pmatrix} X \\ Y \\ Z \\ 1 \end{pmatrix}$

...the perspective projection is

$$\tilde{x}_p = PM \begin{pmatrix} X \\ Y \\ Z \\ 1 \end{pmatrix} \longrightarrow \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} \tilde{x}_{p_x} / \tilde{x}_{p_z} \\ \tilde{x}_{p_y} / \tilde{x}_{p_z} \end{bmatrix}$$

# Projection Matrices

- Basic Perspective Projection:

$$\begin{bmatrix} f & 0 & 0 \\ 0 & f & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

- Basic Orthographic:

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

# 4x4 Matrices

- How do we encode into 4x4 matrix/vector multiplication pipeline?
- See black board...

# Projection Matrices

- Passthrough Z Perspective Projection:

$$\begin{bmatrix} n & 0 & 0 & 0 \\ 0 & n & 0 & 0 \\ 0 & 0 & n + f & -nf \\ 0 & 0 & 1 & 0 \end{bmatrix}$$

If ( $Z = n$ ), then  $z = \left( n + f - \frac{nf}{n} \right) = n$

If ( $Z = f$ ), then  $z = \left( n + f - \frac{nf}{f} \right) = f$

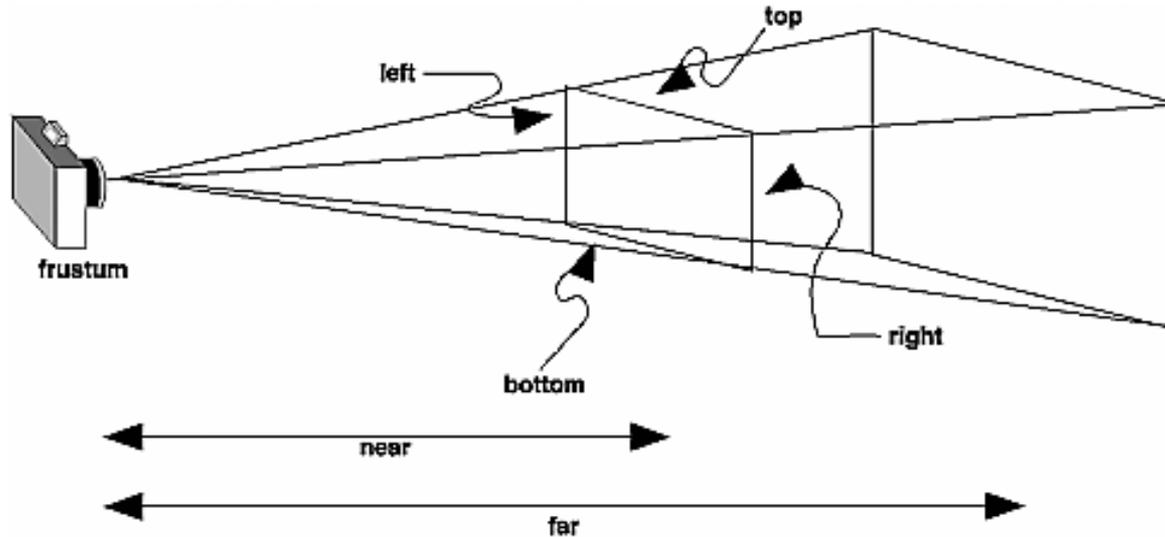

# Projection Matrices

- To map  $[-1,+1]$  to viewing frustum  $(l,r,b,t,n,f)$ :

$$\begin{bmatrix} 2n/(r-l) & 0 & 0 & -(r+l)/(r-l) \\ 0 & 2n/(t-b) & 0 & -(t+b)/(t-b) \\ 0 & 0 & 2n/(n-f) & -(n+f)/(n+f) \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

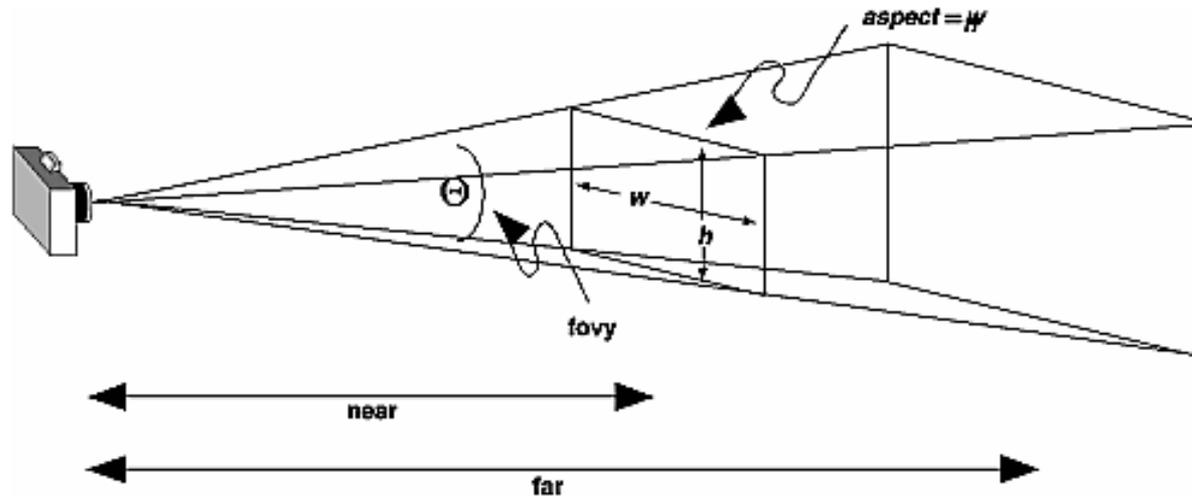

# Projection Transformations

```
void glFrustum(GLdouble left, GLdouble right, GLdouble  
bottom, GLdouble top, GLdouble near, GLdouble far);
```

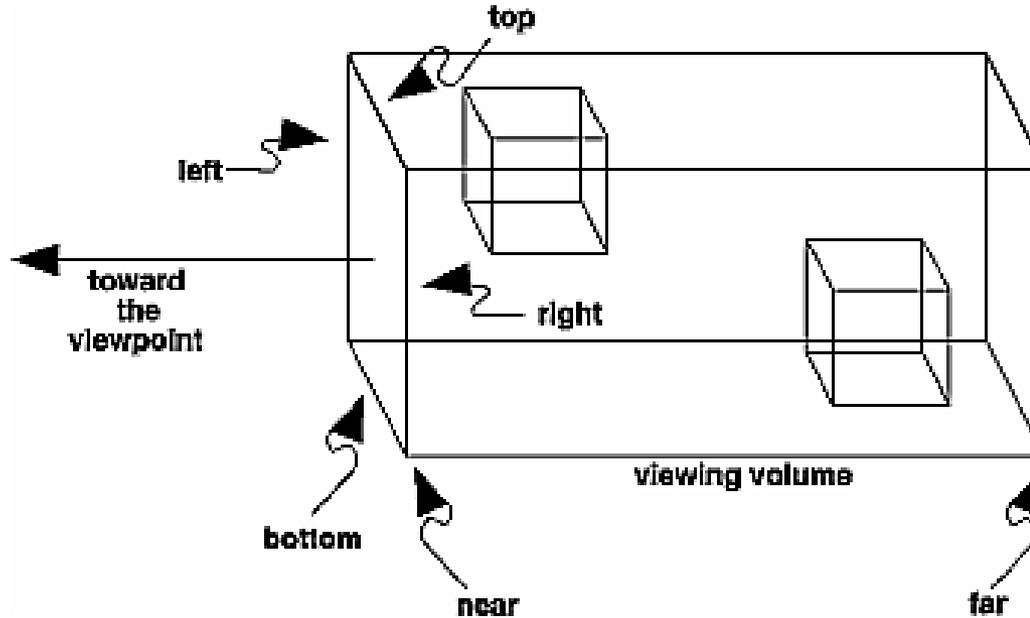

# Projection Transformations

```
void gluPerspective(GLdouble fovy, GLdouble aspect, GLdouble near, GLdouble far);
```

# Projection Transformations

```
void glOrtho(GLdouble left, GLdouble right, GLdouble  
             bottom,  
             GLdouble top, GLdouble near, GLdouble far);
```

```
void gluOrtho2D(GLdouble left, GLdouble right,  
                GLdouble bottom, GLdouble top);
```

# OpenGL Equivalent

```
...  
glMatrixMode(GL_PROJECTION);  
...  
gluPerspective(60, 1.0, 0.1, 1000.0);  
...  
glMatrixMode(GL_MODELVIEW);  
...  
glTranslatef(tx, ty, tz);  
glRotatef(rx, 1, 0, 0);  
glRotatef(ry, 0, 1, 0);  
glRotatef(rz, 0, 0, 1);  
  
/* or glLoadMatrixf(mat); */  
...
```

# OpenGL Note

- OpenGL is row major and left-multiplies
- This means from the previous (more intuitive explanation) the actual matrix is the transpose of what I wrote; e.g.  $M_{OpenGL} = M^T$
- Also, the order of multiplication is from most recent matrix command to least recent matrix command; e.g.
  - “glRotate(rx,1,0,0); glRotate(ry,0,1,0)” rotates a vertex about the y-axis and then the x-axis

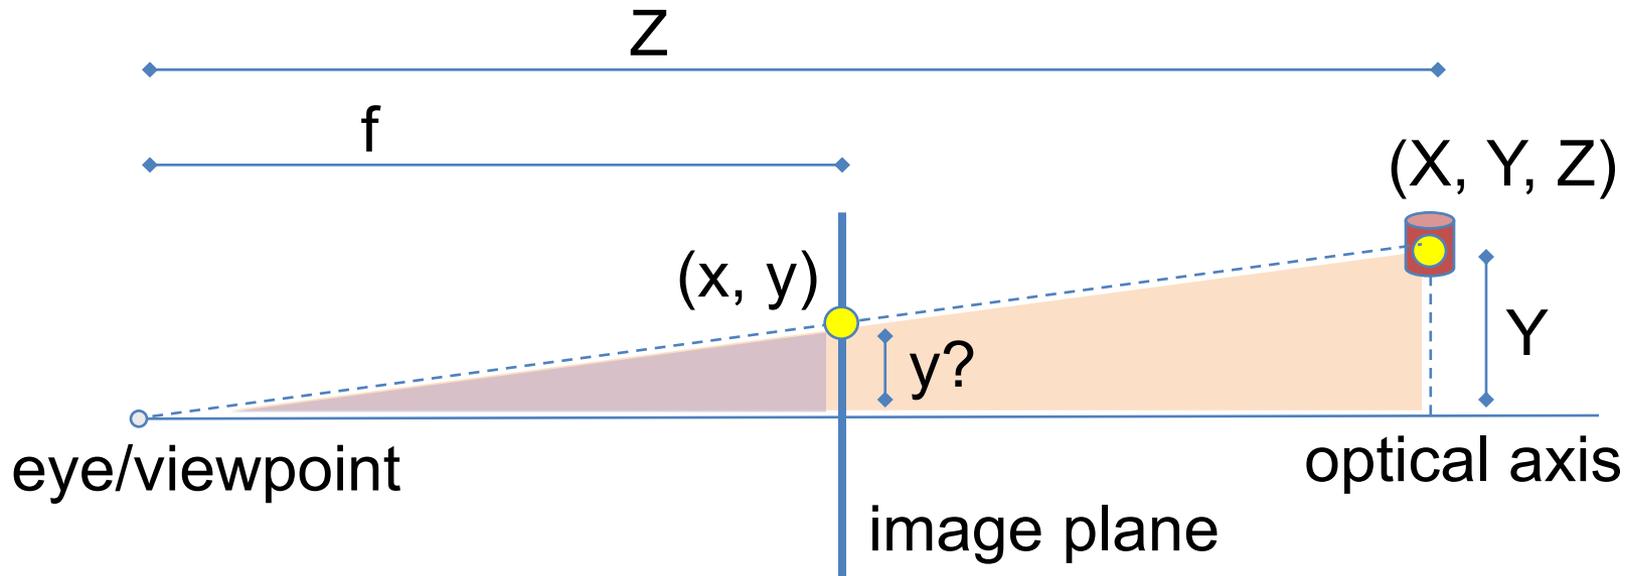

# Producing a 3D World

- Camera
  - **Zero lens model (i.e., no lens)**
  - Thin lens model
  - Thick lens model

# (Zero Lens) Perspective Projection

$$\frac{y}{f} = \frac{Y}{Z}$$

$$y = f \frac{Y}{Z} \quad \& \quad x = f \frac{X}{Z}$$

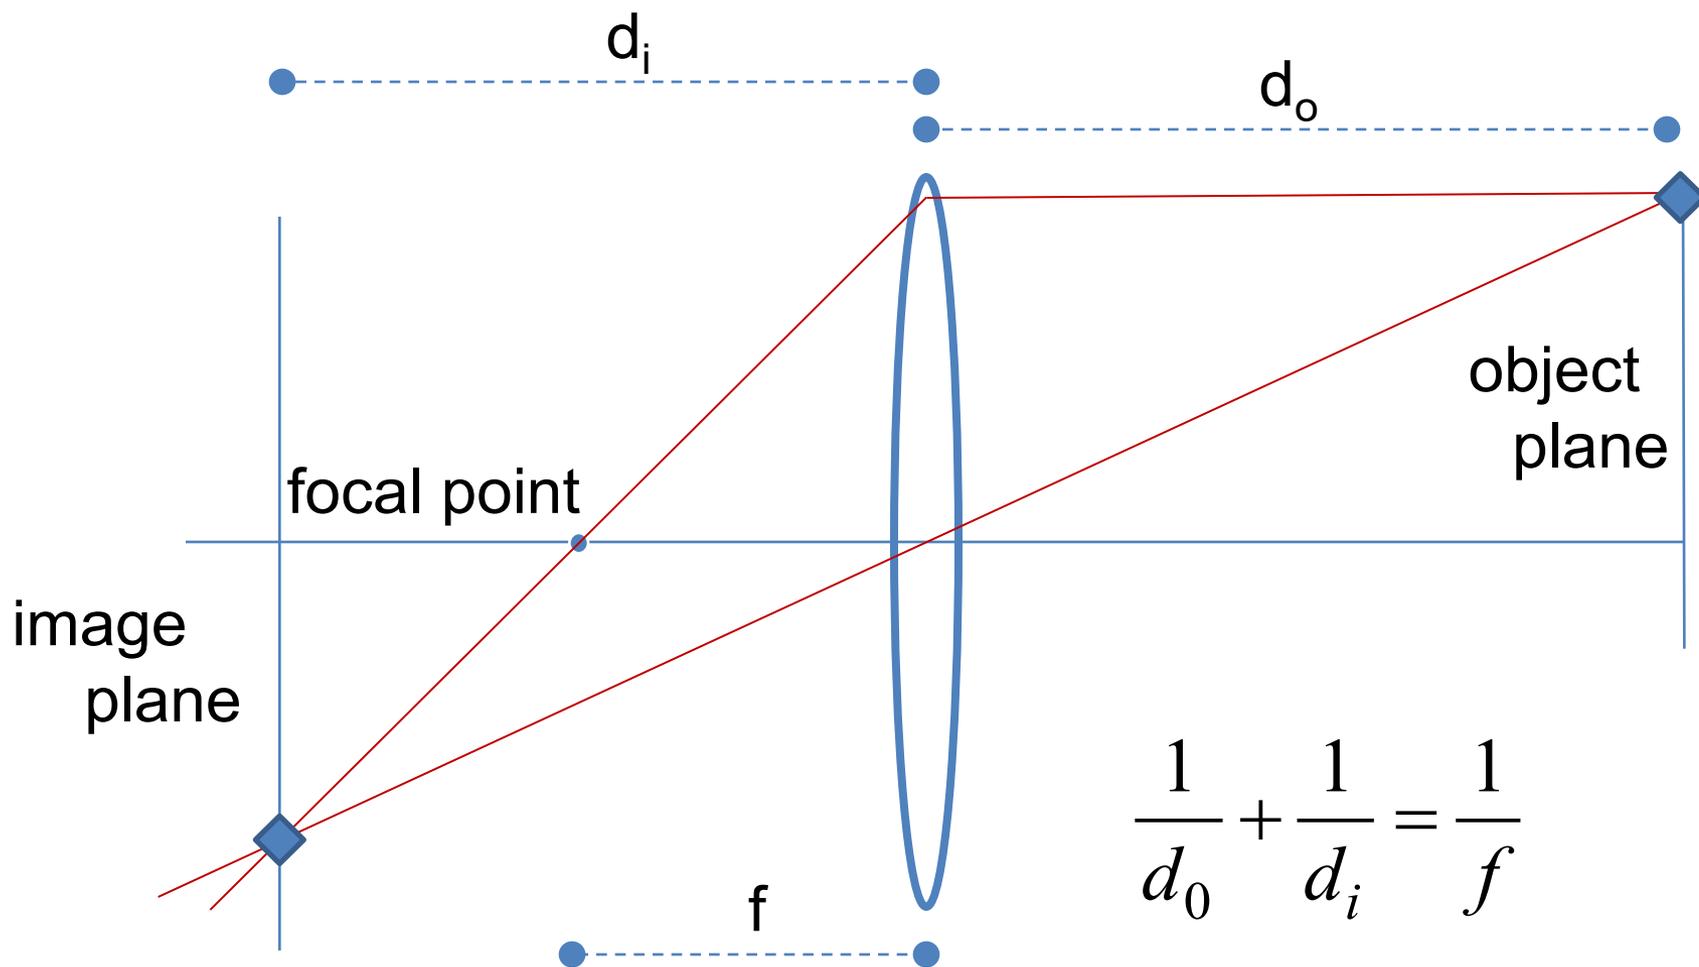

# Producing a 3D World

- Camera
  - Zero lens model (i.e., no lens)
  - **Thin lens model**
  - Thick lens model

# Thin Lens Camera Model

$$\frac{1}{d_o} + \frac{1}{d_i} = \frac{1}{f}$$

# Lens Aberrations

- A “real” lens system does not produce a perfect image
- Aberrations are caused by imperfect manufacturing and by our approximate models
  - Lenses typically have a spherical surface
    - Aspherical lenses would better compensate for refraction but are more difficult to manufacture
  - Typically 1<sup>st</sup> order approximations are used
    - Remember  $\sin \Omega = \Omega - \Omega^3/3! + \Omega^5/5! - \dots$
    - Thus, thin-lens equations only valid iff  $\sin \Omega \approx \Omega$

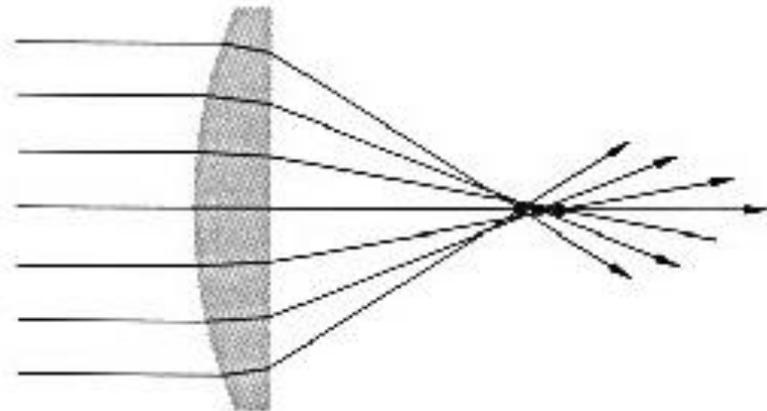

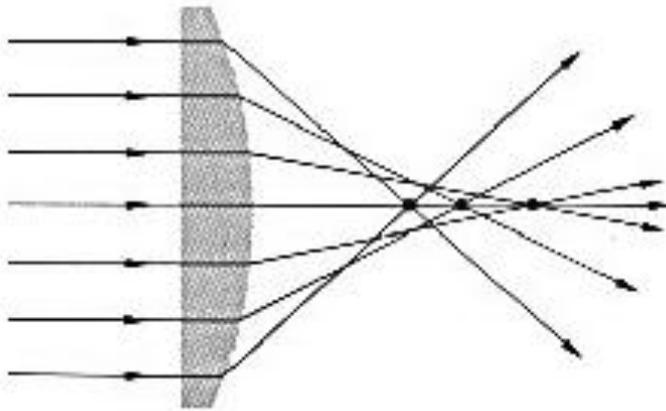

# Aberrations

- Most common aberrations:
  - Spherical aberration
  - Coma
  - Astigmatism
  - Curvature of field
  - Chromatic aberration
  - **Distortion**

# Spherical Aberration

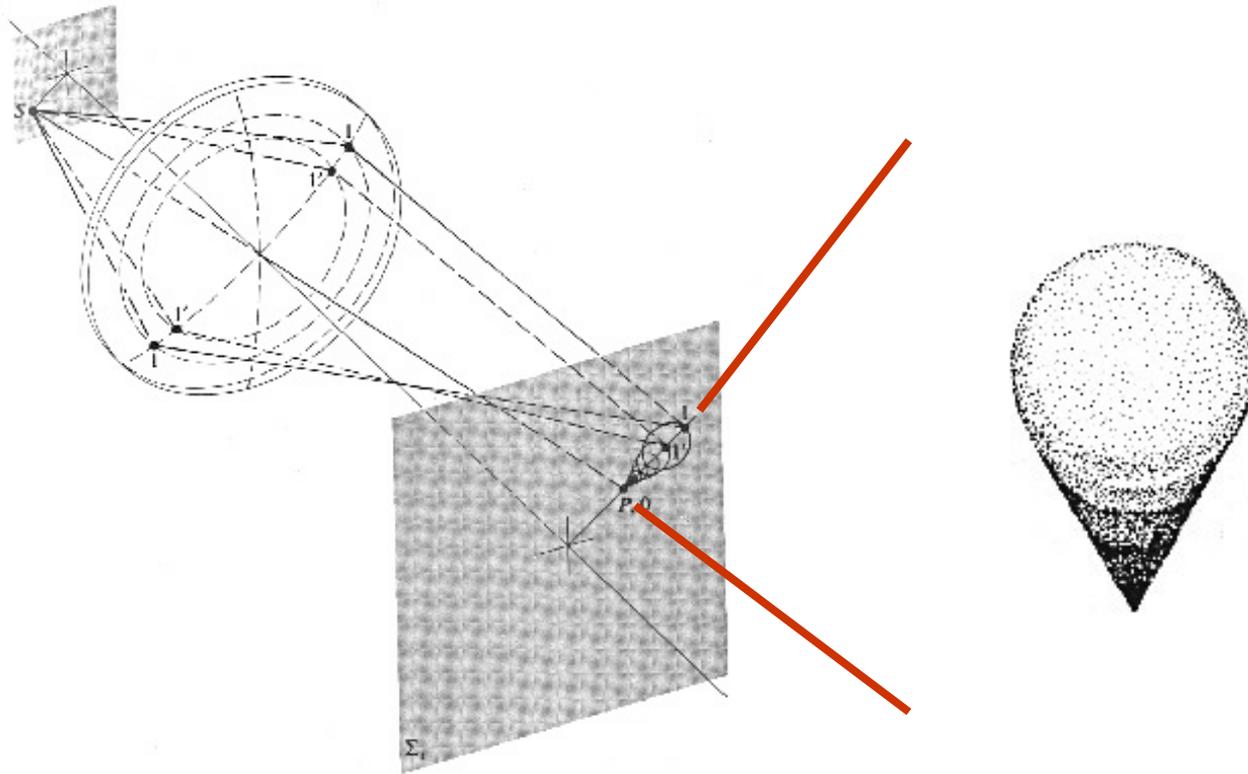

- Deteriorates axial image

# Coma

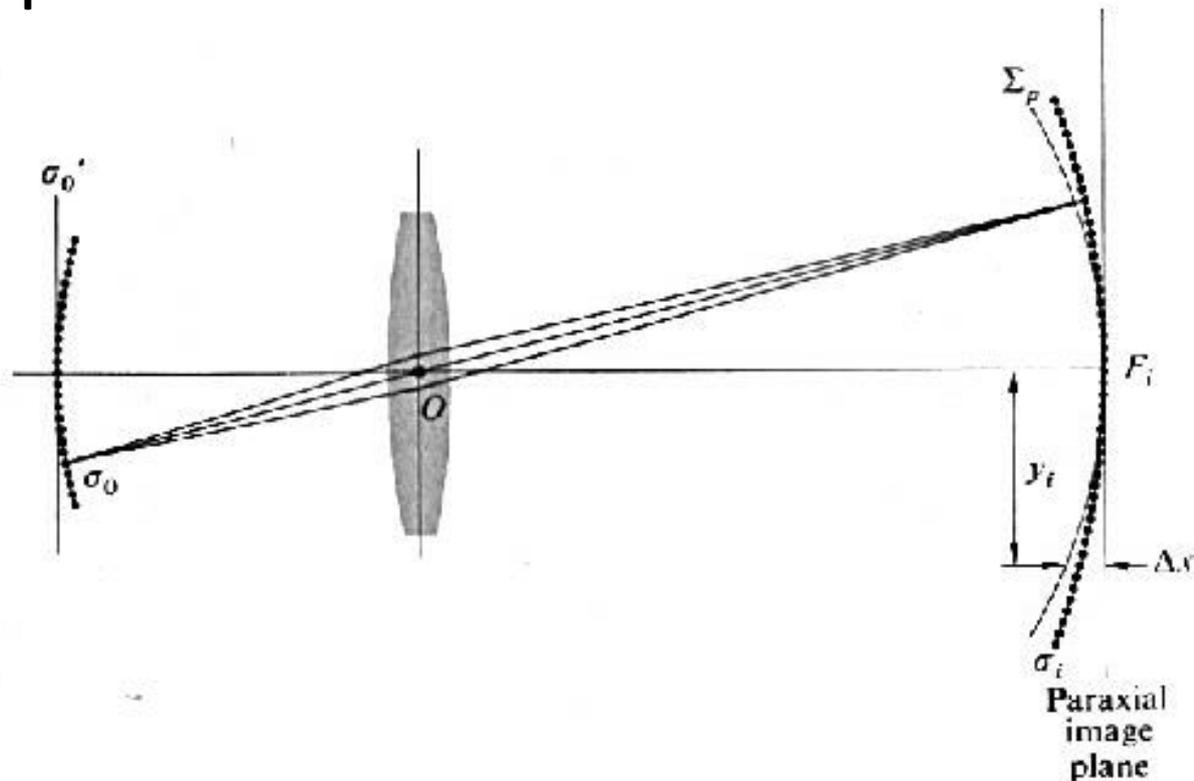

- Deteriorates off-axial bundles of rays

# Astigmatism and Curvature of Field

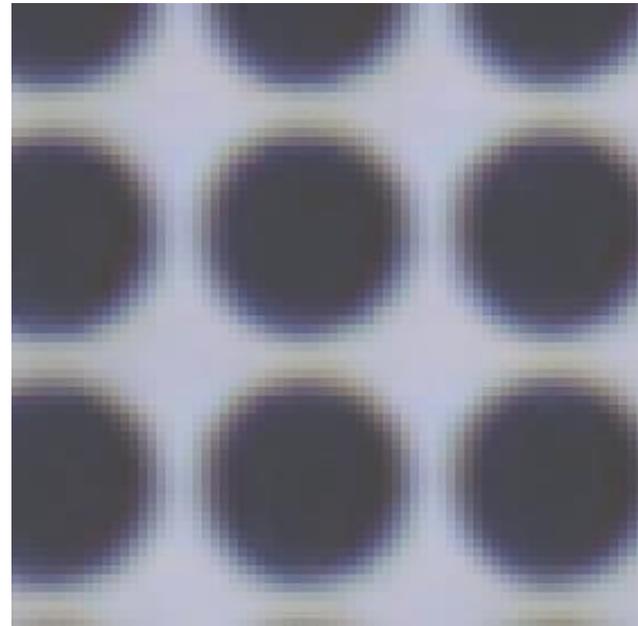

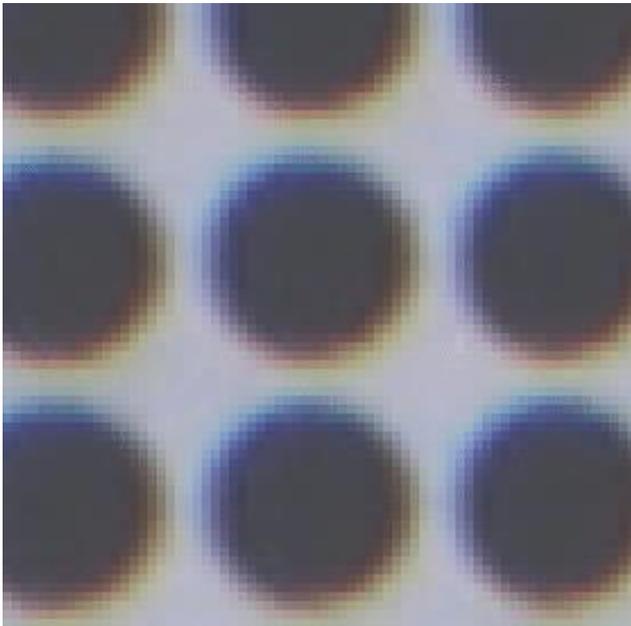

- Produces multiple (two) images of a single object point

# Chromatic Aberration

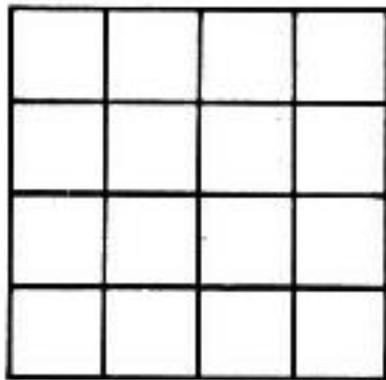

- Caused by wavelength dependent refraction
  - Apochromatic lenses (e.g., RGB) can help

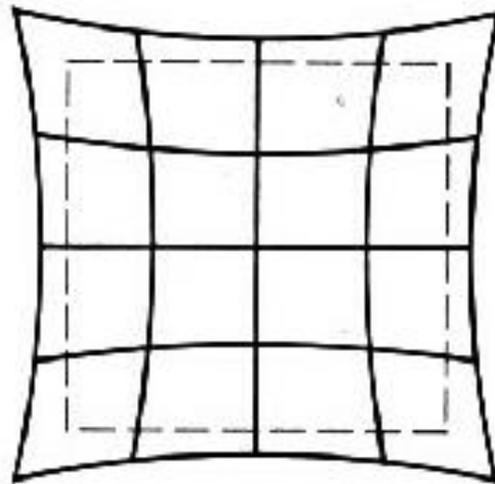

# Distortion

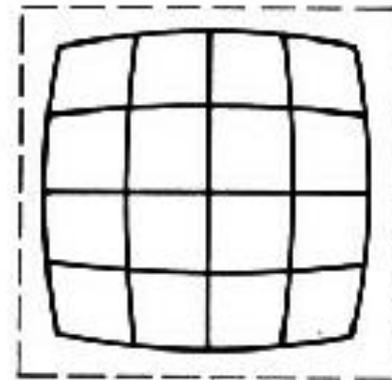

- Radial (and tangential) image distortions

Orthoscopic

Pin-cushion  
distortion

Barrel  
distortion

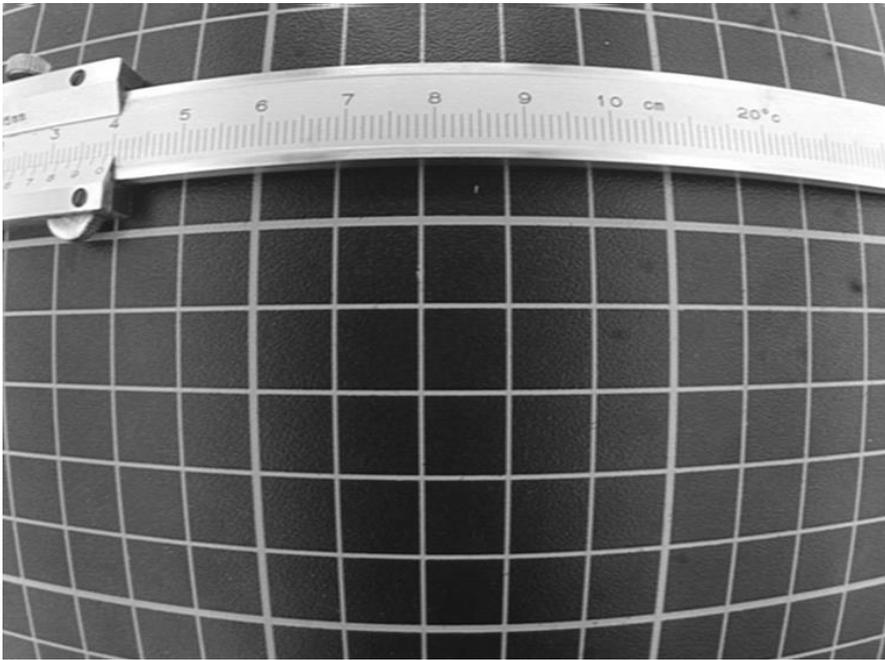

# Radial Distortion

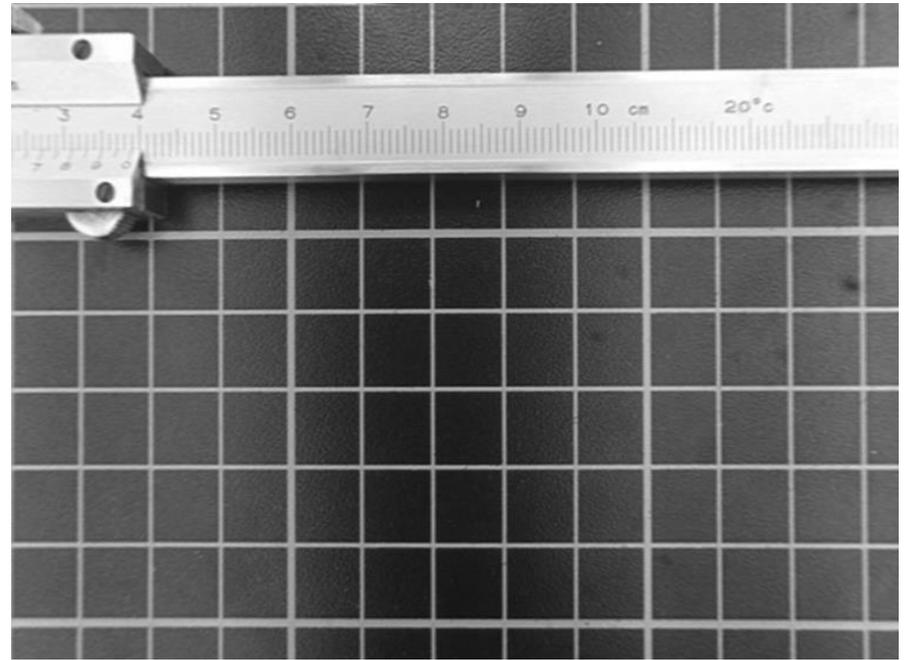

- $(x, y)$  pixel before distortion correction
- $(x', y')$  pixel after distortion correction
- Let  $r = (x^2 + y^2)^{-1}$
- Then
  - $x' = x(1 - \Delta r/r)$
  - $y' = y(1 - \Delta r/r)$
  - where  $\Delta r = k_0 r + k_1 r^3 + k_2 r^5 + \dots$
- Finally,
  - $x' = x(1 - k_0 - k_1 r^2 - k_2 r^4 - \dots)$
  - $y' = y(1 - k_0 - k_1 r^2 - k_2 r^4 - \dots)$

# Radial Distortion

before

after

# Tsai Camera Model and Calibration

- A widely used camera model to calibrate conventional cameras based on a pinhole camera
- Reference
  - “A Versatile Camera Calibration Technique for High-Accuracy 3D Machine Vision Metrology Using Off-the-Shelf TV Cameras and Lenses”, Roger Y. Tsai, IEEE Journal of Robotics and Automation, Vol. 3, No. 4, August 1987

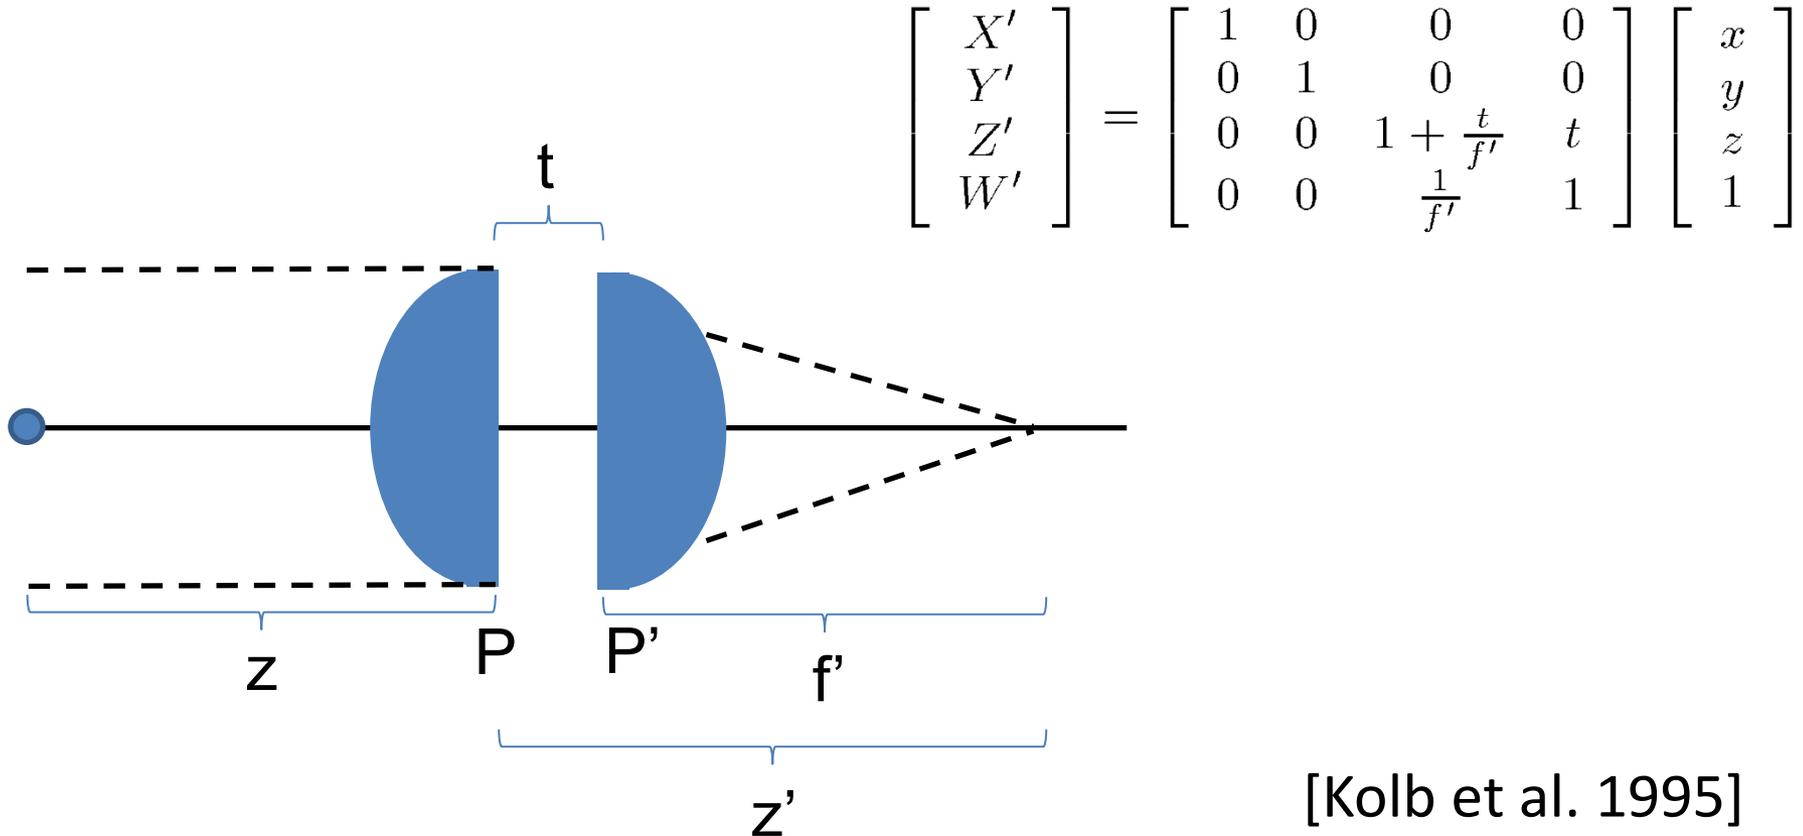

# Producing a 3D World

- Camera
  - Zero lens model (i.e., no lens)
  - Thin lens model
  - **Thick lens model**

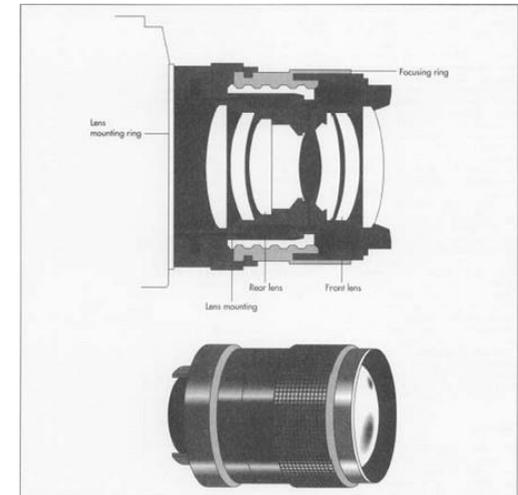

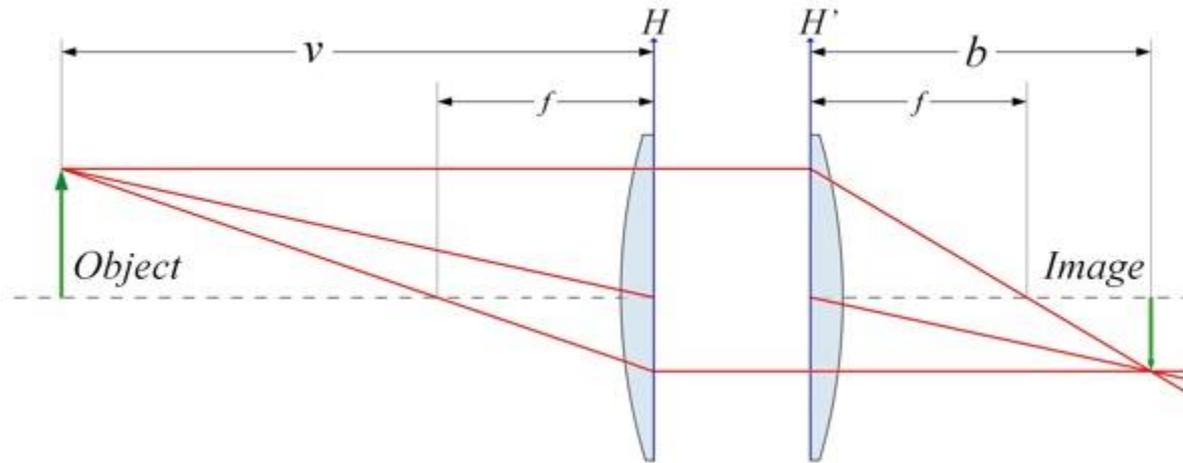

# Thick Lens Camera Model

- A simplification for 4x4 matrix usage

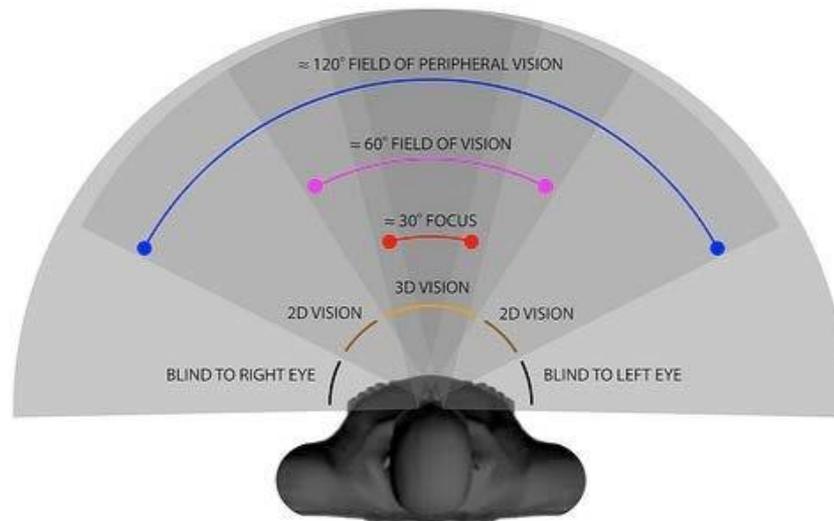

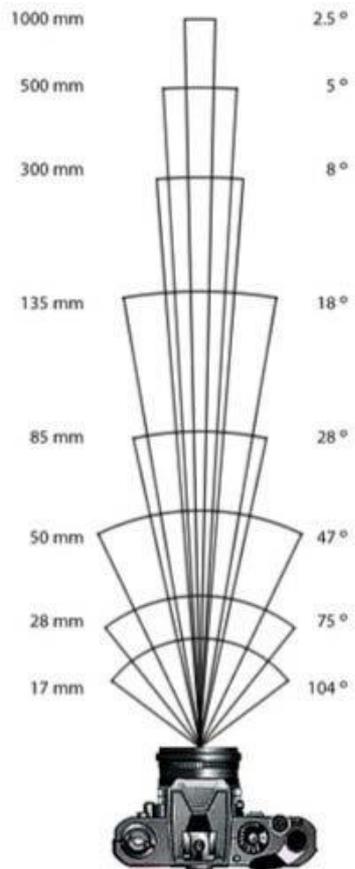

# Thick Lens Camera Model

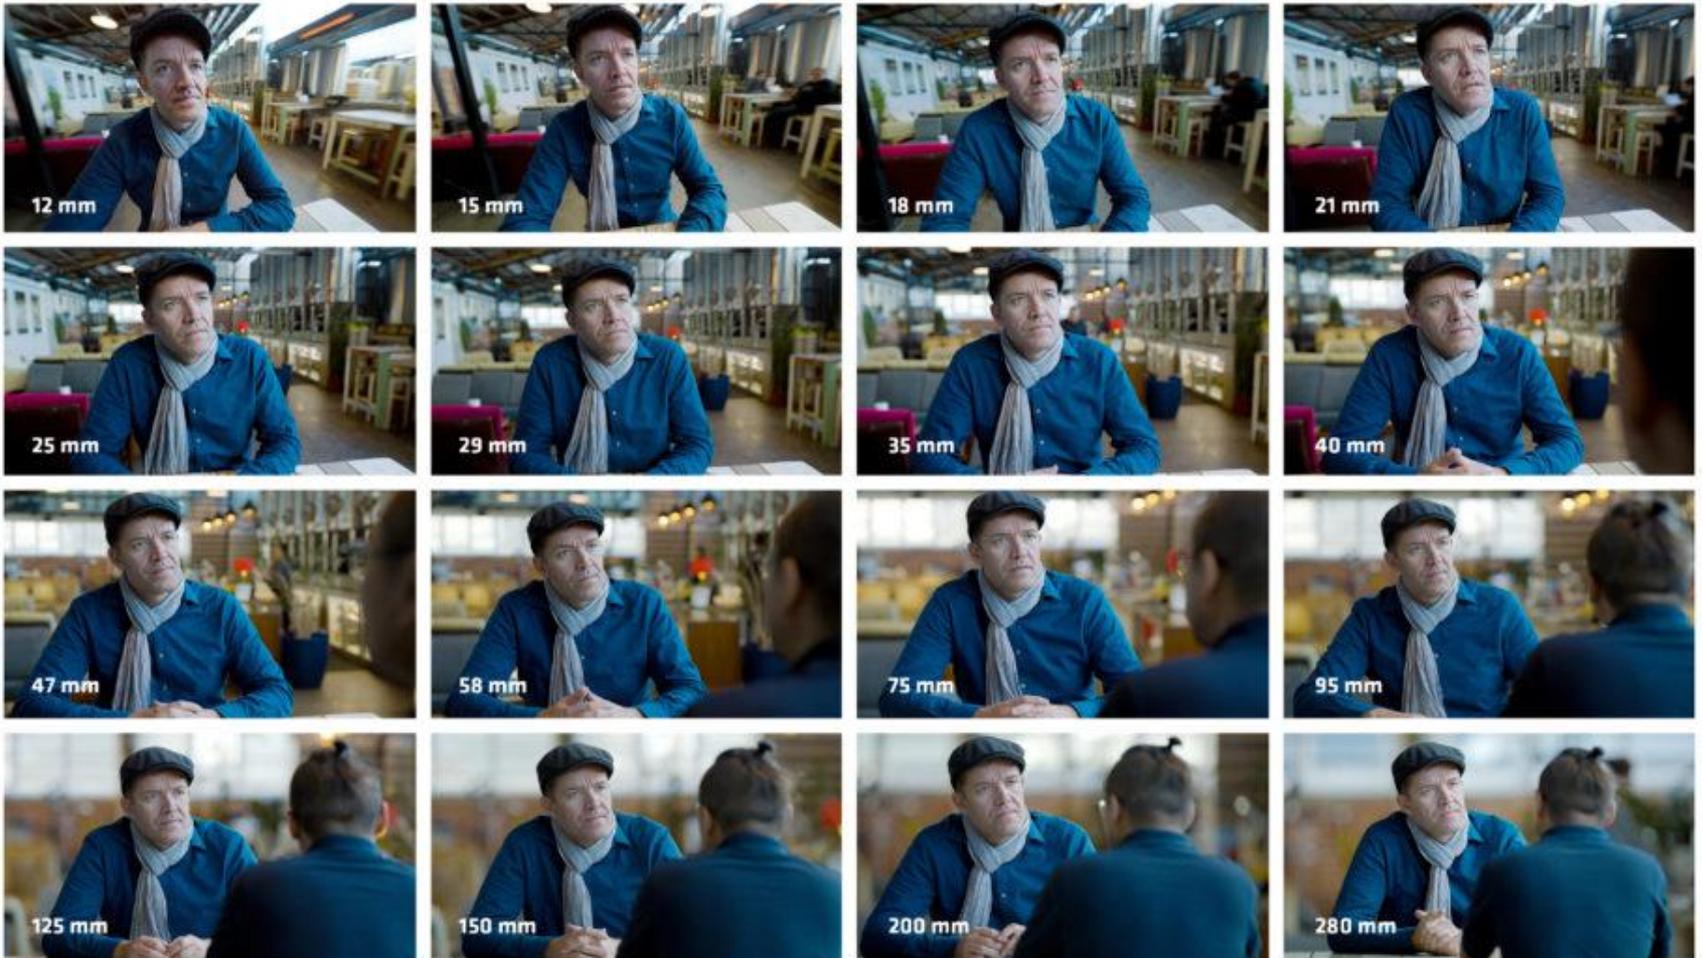

- <http://www.cabrillo.edu/~jmccullough/Applets/optics.html>
- Even more parameters...

# Field of view

# ~50mm is “natural”

# Thin lens system....

- Maybe 120-degrees max?

# Thick lens system...

# Other options

- Spherical cameras
- Equirectangular imaging
- Cylindrical cameras
- And more
