

receiver is currently writing to slot 31. It keeps advancing forward, just checking it doesn't wrap past the business logic consumer

Journaler

replicator

un-marshaller

business logic consumer

journaler and replicator are both reading slot 24. They can keep reading forwards up to slot 30

un-marshaller went off for a tea break, so is back to 15. It may go as far as 30

business logic consumer cannot go past any of the other three, so must wait at slot 14 until the un-marshaller gets back from its tea break
