

# Lecture 1

## Introduction to Computational Geometry

Elisha Sacks

# Computational Geometry

Algorithmic study of combinatorial geometry.

- ▶ Many simple elements (points, lines, circles, triangles).
- ▶ Mostly 2D and 3D; some higher dimensions.
- ▶ Queries and constructions.
- ▶ Optimal algorithms and lower bounds.

# Parameters and Predicates

- ▶ Geometry is modeled with numerical parameters.
- ▶ The most common case is points with Cartesian coordinates.
- ▶ Predicates are signs of polynomials in these parameters.
- ▶ Geometric properties are expressed as predicates.
- ▶ Example: a path  $abc$  is a left or right turn if

$$LT(a, b, c) = (c_x - b_x)(a_y - b_y) - (c_y - b_y)(a_x - b_x)$$

is positive or negative. We will see why later.

- ▶ The zero (degenerate) case is rare but important.

# Line Segment Intersection

When do segments  $ab$  and  $cd$  intersect?

- ▶ Can test if the line intersection point is on both segments.

# Line Segment Intersection

When do segments  $ab$  and  $cd$  intersect?

- ▶ Can test if the line intersection point is on both segments.
- ▶ But the intersection point is not needed.

# Line Segment Intersection

When do segments  $ab$  and  $cd$  intersect?

- ▶ Can test if the line intersection point is on both segments.
- ▶ But the intersection point is not needed.
- ▶ Check if  $c$  and  $d$  are on opposite sides of the  $ab$  line, and if  $a$  and  $b$  are on opposite sides of the  $cd$  line.

# Line Segment Intersection

When do segments  $ab$  and  $cd$  intersect?

- ▶ Can test if the line intersection point is on both segments.
- ▶ But the intersection point is not needed.
- ▶ Check if  $c$  and  $d$  are on opposite sides of the  $ab$  line, and if  $a$  and  $b$  are on opposite sides of the  $cd$  line.
- ▶ Intersection test:  
 $LT(a, b, c)LT(a, b, d) < 0$  and  $LT(c, d, a)LT(c, d, b) < 0$ .

# Point in Polygon

- ▶ A polygon is represented by its vertices in boundary order.
- ▶ What is an algorithm for testing if a point is inside a polygon?

# Point in Polygon

- ▶ A polygon is represented by its vertices in boundary order.
- ▶ What is an algorithm for testing if a point is inside a polygon?
- ▶ Any ray based at  $a$  intersects  $p$  an odd number of times.

# Point in Polygon

- ▶ A polygon is represented by its vertices in boundary order.
- ▶ What is an algorithm for testing if a point is inside a polygon?
- ▶ Any ray based at  $a$  intersects  $p$  an odd number of times.
- ▶ What about special cases?

# Polygon Intersection

When do polygons  $p$  and  $q$  intersect?

# Polygon Intersection

When do polygons  $p$  and  $q$  intersect?

- ▶ Two edges intersect,  $p$  is inside  $q$ , or  $q$  is inside  $p$ .
- ▶ We know how to test for edge intersection.
- ▶ There is a faster algorithm called a line sweep.
- ▶ If no edges intersect,  $p$  is inside  $q$  if any vertex of  $p$  is inside  $q$ .

# Convex Hull

(a) Input.

(b) Output.

Smallest convex region containing  $n$  points.

- ▶ 2D:  $n \log n$ .
- ▶ 3D:  $n \log n$ .

# Polygon Triangulation

Decompose a polygon with  $n$  vertices into triangles.

- ▶ 2D:  $n \log n$ .
- ▶ 3D: decompose a polyhedron into tetrahedrons.
- ▶ Need to add vertices (Steiner points) for some inputs.
- ▶  $nr + r^2 \log r$  for  $r = O(n^2)$  reflex edges.

# Range Search

Find points in axis-aligned box.

- ▶ Input size is  $n$ ; output size is  $k$ .
- ▶ 2D:  $k + \log n$  query;  $n \log n$  preprocessing.
- ▶ 3D:  $k + \log^2 n$  query;  $n \log^2 n$  preprocessing.
- ▶ Octrees: fast in practice.

## Point Location

Locate the cell that contains a point in a mesh with  $n$  vertices.

- ▶ 2D:  $\log n$  query;  $n \log n$  preprocessing.
- ▶ 3D: open problem!

# Voronoi Diagram

Compute the region that is closest to each of  $n$  sites.

- ▶ 2D:  $n \log n$ .
- ▶ 3D:  $k + n \log n$  for output size  $k = O(n^2)$ .

# Delaunay Triangulation

Triangulate  $n$  vertices with a maximal minimum angle.

- ▶ Equivalent to Voronoi diagram.
- ▶ convex hull in dimension  $d$  gives Delaunay triangulation in dimension  $d - 1$ .

## Other Topics

- ▶ Robustness and ACP
- ▶ Linear programming
- ▶ Persistent binary trees
- ▶ Duality
- ▶ Binary space partitions
- ▶ Robot motion planning
- ▶ Meshing
- ▶ Euclidean shortest paths
- ▶ Differential and projective geometry
- ▶ Mechanism kinematics
