Absolute Stability

→ the ability of a scheme to correctly get model

$$\frac{dy}{dt} = \lambda y \quad \lambda \in \mathbb{C}$$

where $\text{Re}(\lambda) < 0$.
i.e. (correctly model)

$$y_k \rightarrow 0$$

$$\frac{dy}{dt} = Ay$$

$$A = U\Lambda U^T$$

$$\downarrow$$

$$\frac{du_1}{dt} = \lambda_1 u_1(t)$$

$$\frac{du_2}{dt} = \lambda_2 u_2(t)$$

$$;$$

$$\text{FE} \quad \frac{dy}{dt} = \lambda y = A(t)y$$

$$y_{k+1} = y_k + h f(t_k, y_k)$$

$$= y_k + h \lambda y_k$$

$$= (1 + h\lambda) y_k$$

$$= (1 + h\lambda)(1 + h\lambda) y_{k-1}$$

$$= (1 + h\lambda)^k y_0$$

$$\text{if } y_k \rightarrow 0 \Leftrightarrow (1 + h\lambda)^k \rightarrow 0$$

$$\Leftrightarrow \rho^k \rightarrow 0$$

$$\rho = 1 + h\lambda$$

$$\text{if } |\rho| < 1, \text{ then } y_k \rightarrow 0$$

$$|1 + h\lambda| < 1 \text{ to get "correct"}$$

$$\text{Correct(h)} \subset$$

$$\text{Re}(h\lambda)$$

$$\text{Re}(\lambda) < 0, h > 0$$

$$\text{for Heun's method!}$$

$$|1 + h\lambda + \frac{(h\lambda)^2}{2}|$$

$$|1 + h\lambda + \frac{(h\lambda)^2}{2}|$$

$$|1 + h\lambda + \frac{(h\lambda)^2}{2}|$$

$$|1 + h\lambda + \frac{(h\lambda)^2}{2}|$$

$$|1 + h\lambda + \frac{(h\lambda)^2}{2}|$$

$$\text{Lots of Terms}$$

$$\text{Absolute Scheme/Method}$$

$$y_{k+1} = y_k + h \text{Step}[y_k, t, h]$$

$$\downarrow$$

$$\text{What your comp. does!}$$

$$\text{Ex: FE}$$

$$\text{Step}(y_k, t, h) = f(t, y_k)$$

$$\text{Heun ... more complicated!}$$

$$\text{Heun ... more complicated!}$$

$$\text{Heun ... more complicated!}$$

$$\text{Consistency (Consistent)}$$

$$\text{Local Truncation Error}$$

$$\text{Stability (NOT Abs. Stability)}$$

$$\rightarrow \text{Everything will be stable!}$$

$$\text{Global Error}$$

$$\text{Converged (Convergence)}$$

$$\text{A method is convergent}$$

$$\text{if as } h \rightarrow 0$$

$$\text{then } y_k \rightarrow y^*(t, h)$$

$$\text{then we say step has}$$

$$\rightarrow \text{A step is consistent if}$$

$$\lim_{h \rightarrow 0} \text{Step}(y_k, t, h) = f(t, y_k)$$

$$\rightarrow \text{How good is step vs. } \frac{dy}{dt}$$

$$\text{if}$$

$$\text{if}$$

$$\frac{y^*(t+h) - y^*(t)}{h} - \text{Step}(y^*(t), t, h) = O(h)$$

$$\text{then we say step has}$$

$$\text{then we say step has}$$

$$\text{then we say step has}$$

$$\text{then we say step has}$$

$$\text{Local Truncation Error } O(h)$$

$$\text{if } \text{Step-Step} = O(h^2)$$

$$\Rightarrow \text{local truncation error} = O(h^2)$$

$$\Rightarrow \text{local truncation error} = O(h^2)$$

$$\Rightarrow \text{local truncation error} = O(h^2)$$

$$\Rightarrow \text{local truncation error} = O(h^2)$$

$$\Rightarrow \text{local truncation error} = O(h^2)$$

$$\Rightarrow \text{local truncation error} = O(h^2)$$

$$\Rightarrow \text{local truncation error} = O(h^2)$$

$$\Rightarrow \text{local truncation error} = O(h^2)$$
