### Theorem (PHP)

For any placement of (kn + 1) pigeons in n holes, there exists a hole with at least (k + 1) pigeons.

# Monochromatic Triangles in 2-Colorings

#### Theorem

Any 2-coloring of  $K_6$  contains a monochromatic triangle.

- If possible let there exists a 2-coloring of  $K_6$  that contains no monochromatic triangles
- Consider any vertex v in  $K_6$
- There are 5 edges in  $K_6$  that are incident on v
- By PHP, at least 3 of them have the same color
- Let edges (v, a), (v, b) and (v, c) are colored red
- Now, (*a*, *b*) must be colored blue (otherwise {*v*, *a*, *b*} forms a monochromatic triangle)
- Similarly, (b, c) and (c, a) must be colored blue
- Then,  $\{a, b, c\}$  forms a monochromatic triangle
- Hence, contradiction

< ロ > < 同 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

• Think: Give a 2-coloring of K<sub>5</sub> that has no monochromatic triangles

#### Theorem

Any 2-coloring of K<sub>6</sub> contains 2 monochromatic triangles.

- Define: A *biangle centered at b* is a set  $\{a, b, c\}$  such that the edge (a, b) and (b, c) has different colors
- If possible, consider a coloring of *K*<sub>6</sub> with at most 1 monochromatic triangle
- There are  $\begin{pmatrix} 6\\ 3 \end{pmatrix} = 20$  triangles in  $K_6$
- A monochromatic triangle has 0 biangles
- A non-monochromatic triangle has 2 biangles
- This coloring has at least 20 1 = 19 non-monochromatic triangles and, hence, at least 38 biangles

Proof Continued...

- By PHP, there exists a vertex v such that it has at least 7 biangles centered at v
- But in  $K_6$ , any vertex either has 0, 4 or 6 biangles centered at it
- Hence, contradiction

- Think: Construct a 2-coloring for *K*<sub>6</sub> that has exactly 2 monochromatic triangles
- Think: Prove that any 2-coloring of K<sub>7</sub> has at least 4 monochromatic triangles

- A Mathematical Gem:

#### Theorem (Van der Waerden Theorem)

For any r, k, there exists n such that any r-coloring of  $\{1, ..., n\}$  has a monochromatic arithmetic progression of length k.

・ロト ・ 一日 ・ ・ 日 ・ ・ 日 ・ ・

### Theorem (Erdös–Szekeres Theorem)

Any set of distinct numbers  $\{a_1, \ldots, a_n\}$  contains either an increasing subsequence of length (a + 1) or a decreasing subsequence of length (b + 1), where n = ab + 1.

- Define the mapping  $a_i \mapsto (u_i, v_i)$ , where
  - $u_i$  is the length of the longest increasing subsequence in  $\{a_1, \ldots, a_i\}$  that includes  $a_i$ , and
  - $v_i$  is the length of the longest decreasing subsequence in  $\{a_1, \ldots, a_i\}$  that includes  $a_i$ .
- Suppose {a<sub>1</sub>,..., a<sub>n</sub>} has increasing subsequences of length at most a and decreasing subsequences of length at most b
- So, for all  $i \in [n]$ , we have  $1 \leq u_i \leq a$  and  $1 \leq v_i \leq b$
- There are at most *ab* distinct possible tuples  $(u_i, v_i)$
- By PHP, there exists i < j such that  $(u_i, v_i) = (u_j, v_j)$

Proof Continued...

- If a<sub>j</sub> > a<sub>i</sub> then u<sub>j</sub> > u<sub>i</sub> (consider the longest increasing subsequence in {a<sub>1</sub>,..., a<sub>i</sub>} that ends in a<sub>i</sub> and append a<sub>j</sub> to it)
- If  $a_j < a_i$  then  $v_j > v_i$  (similarly)
- Therefore, it is not possible for  $(u_i, v_i) = (u_j, v_j)$ , for i < j
- Hence, contradiction

• Think: (Tightness) Construct a set of *ab* elements that has increasing subsequences of length at most *a* and decreasing subsequences of length at most *b* 

< ロ > < 同 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

## Application

Let  $S_n$  be the set of all permutations of the set [n]. The expression  $\pi \stackrel{s}{\leftarrow} S_n$  represents a permutation drawn uniformly at random from  $S_n$ . Let  $inc(\pi)$  denote the length of the longest increasing subsequence in the permutation  $\pi$ .

#### Theorem

$$\mathbb{E}_{\substack{ \bullet : \mathfrak{s} \\ \mathsf{s} \\ \mathsf{s} }} [\operatorname{inc}(\pi)] \ge \frac{\sqrt{n-1}}{2} + 1$$

 $\pi$ 

- Note that  $\pi$  either has an increasing or decreasing subsequence of length  $\sqrt{n-1}+1$
- So,  $\pi$  or reverse of  $\pi$  has an increasing sequence of length at least  $\sqrt{n-1}+1$
- The other of the two permutations has an increasing sequence of length at least 1
- So, the expected length of the longest increasing sequence over  $\pi$  and reverse of  $\pi$  is  $\frac{\sqrt{n-1}}{2} + 1$

- Think: Prove  $\mathbb{E}_{\pi \leftarrow S_n} [\operatorname{inc}(\pi)] = \Theta(\sqrt{n})$
- 2 Think: How does the distribution  $inc(\pi)$  look, for  $\pi \stackrel{s}{\leftarrow} S_n$ ?
- Think: How to show that the distribution is strongly concentrated around its mean with variance  $\approx n^{1/4}$ ?

## PHP as Probability

Let *M* be a matrix. Let  $M(r, c) \in [0, \infty)$  be the entry corresponding to the row *r* and column *c*. Let *R* and *C* be some distribution over the rows and columns respectively. The expression  $r \sim R$  represents that the row *r* is drawn according to the distribution *R* and the expression  $c \sim C$  represents that the column *c* is drawn according to the distribution *C*.

Theorem	
Suppose	
	$\mathbb{E}_{\substack{r\sim R\\c\sim C}}[M(r,c)]\leqslant \varepsilon$
	c~C
If $\varepsilon = lpha eta$ then,	
	$\Pr_{\boldsymbol{c}\sim \boldsymbol{C}}\left[ \underset{\boldsymbol{r}\sim \boldsymbol{R}}{\mathbb{E}} \left[ \boldsymbol{M}(\boldsymbol{r},\boldsymbol{c}) \right] \geq \alpha \right] \leq \beta$

- Think: Prove it
- Think: How our first PHP is a special case of this?
