Lecture 03: Probability Basics

Probability Basics

・ロト ・四ト ・ヨト ・ヨト

In today's lecture we shall continue with the basics of probability

・ロト ・聞ト ・ヨト ・ヨト

э

- ${\small \bullet} {\small \ \ Let} \ {\mathbb X} \ be \ a \ random \ variable \ over \ the \ sample \ space \ \Omega$
- **2** An event *E* is a subset of Ω
- **③** The probability that the random variable \mathbb{X} takes values in the set *E* is

$$\sum_{x \in \Omega: \ x \in E} \mathbb{P}\left[\mathbb{X} = x\right]$$

We succinctly represent this probability by the following expression

$$\mathbb{P}[\mathbb{X} \in E]$$

< □→ < □→ < □→

Chain Rule for Events

- $\bullet\,$ Let $\mathbb X$ be a random variable over the sample space Ω
- Let E_1, E_2, \ldots, E_k be events
- The probability that the random variable simultaneously satisfies all the events is represented by

$$\mathbb{P}\left[\mathbb{X}\in E_1,\ldots,\mathbb{X}\in E_k\right]$$

• The chain rule states that, the probability is equal to the following expression

$$\mathbb{P} [\mathbb{X} \in E_1]$$

$$\times \mathbb{P} [\mathbb{X} \in E_2 | \mathbb{X} \in E_1]$$

$$\times \mathbb{P} [\mathbb{X} \in E_3 | \mathbb{X} \in E_1, \mathbb{X} \in E_2]$$

$$\vdots$$

$$\times \mathbb{P} [\mathbb{X} \in E_k | \mathbb{X} \in E_1, \dots, \mathbb{X} \in E_{k-1}]$$

Probability Basics

Consider the following experiment described in English

Experiment

Suppose there are n bins. Suppose we throw m balls into n bins such that each balls is thrown uniformly and independently at random into the n possible bins. What is the probability that all balls land in distinct bins?

伺 ト イヨト イヨト

Example Problem II

Let us formalize this problem

- The bins are numbered $\{1, \ldots, n\}$, represented by [n]
- Let $\mathbb{X} = (\mathbb{X}_1, \dots, \mathbb{X}_m)$ be a joint distribution over the sample space $[n]^{\otimes m}$, where \mathbb{X}_i represents the bin that the *i*-th ball falls into
- $\bullet\,$ The random variable \mathbb{X}_i is independent of the random variable

$$(\mathbb{X}_1,\ldots,\mathbb{X}_{i-1},\mathbb{X}_{i+1},\ldots,\mathbb{X}_m)$$

The random variable X_i is a uniform random variable over [n], i.e., for any x ∈ [n], we have

$$\mathbb{P}\left[\mathbb{X}_i = x\right] = 1/n$$

(日) (日) (日)

- Let E be the set of all (x₁,...,x_n) ∈ [n]^{⊗m} such that all x_is are distinct
- We are interested in computing

$$\mathbb{P}[\mathbb{X} \in E]$$

▲御 ▶ ▲ ● ▶

Example Problem IV

Technique 1.

- Observe that $|\Omega| = n^m$
- For any $x\in \Omega$, we have $\mathbb{P}\left[\mathbb{X}=x
 ight]=1/n^m$
- So, $\mathbb{P}\left[\mathbb{X} \in E\right] = \left|E\right| / n^m$
- We can see that |E| = n(n-1)···(n − m + 1) (This is because the first coordinate can take n possible values, the second coordinate can take (n − 1) possible values, and so on.)
- So, we have

$$\mathbb{P}\left[\mathbb{X}\in E\right]=rac{n(n-1)\cdots(n-m+1)}{n^m}$$

(日本) (日本) (日本)

Example Problem V

Technique 2.

- For i ∈ {1,...,m} define the event E_i as follows
 "Ball i falls in a different bin from the balls {1,2,...,i-1}"
- We are interested in the probability

$$\mathbb{P}\left[\mathbb{X}\in E\right]=\mathbb{P}\left[\mathbb{X}\in E_1,\ldots,\mathbb{X}\in E_m\right]$$

• The main observation is the following

$$\mathbb{P}\left[\mathbb{X}\in E_i|\mathbb{X}\in E_1,\ldots,\mathbb{X}\in E_{i-1}
ight]=\left(1-rac{i-1}{n}
ight)$$

• By chain rule, we have

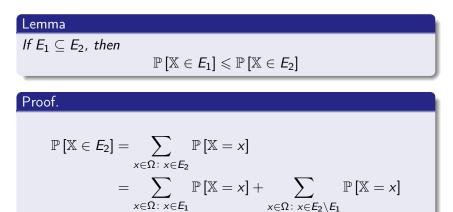

$$\mathbb{P}\left[\mathbb{X}\in E\right] = 1\cdot \left(1-\frac{1}{n}\right)\cdot \left(1-\frac{2}{n}\right)\cdots \left(1-\frac{m-1}{n}\right)$$

<回> < E> < E>

Probability Inequalities I

- ${\color{black} \bullet} {\color{black} \bullet} {\color{$
- 2 Let E_1 and E_2 be two events

 $\geq \mathbb{P}[\mathbb{X} \in E_1]$

Lemma

$\mathbb{P}\left[\mathbb{X}\in E_1,\mathbb{X}\in E_2\right]\leqslant \mathbb{P}\left[\mathbb{X}\in E_1\right]$

Proof.

$$\begin{split} \mathbb{P}\left[\mathbb{X} \in E_1, \mathbb{X} \in E_2\right] &= \mathbb{P}\left[\mathbb{X} \in E_1\right] \cdot \mathbb{P}\left[\mathbb{X} \in E_1 | \mathbb{X} \in E_2\right] \\ &\leqslant \mathbb{P}\left[\mathbb{X} \in E_1\right] \cdot 1 \\ &= \mathbb{P}\left[\mathbb{X} \in E_1\right] \end{split}$$

Probability Basics

э

Lemma (Union Bound)

$\mathbb{P}\left[\mathbb{X}\in E_{1}\cup E_{2}\right]\leqslant\mathbb{P}\left[\mathbb{X}\in E_{1}\right]+\mathbb{P}\left[\mathbb{X}\in E_{2}\right]$

Proof.

$$\mathbb{P}\left[\mathbb{X} \in E_1 \cup E_2\right] = \sum_{x \in \Omega: \ x \in E_1 \cup E_2} \mathbb{P}\left[\mathbb{X} = x\right]$$
$$= \sum_{x \in \Omega: \ x \in E_1} \mathbb{P}\left[\mathbb{X} = x\right] + \sum_{x \in \Omega: \ x \in E_2 \setminus E_1} \mathbb{P}\left[\mathbb{X} = x\right]$$
$$= \mathbb{P}\left[\mathbb{X} \in E_1\right] + \mathbb{P}\left[\mathbb{X} \in E_2 \setminus E_1\right]$$
$$\leq \mathbb{P}\left[\mathbb{X} \in E_1\right] + \mathbb{P}\left[\mathbb{X} \in E_2\right] \qquad \Box$$

Expected Outcome

- Suppose $\Omega \subseteq \mathbb{R}$
- For the purposes of this course we shall restrict to discrete Ω (for example, the set of all natural numbers)
- The expected outcome of the random variable $\mathbb X,$ represented by $\mathbb E\left[\mathbb X\right],$ is the following quantity

$$\mathbb{E}\left[\mathbb{X}\right] = \sum_{x \in \Omega} x \cdot \mathbb{P}\left[\mathbb{X} = x\right]$$

For example: Suppose \mathbb{X} is a random variable over the sample space \mathbb{N} (the set of all natural numbers). The probability $\mathbb{P}[\mathbb{X} = i] = 1/2^i$. So, the expected outcome is defined to be

$$\mathbb{E}\left[\mathbb{X}\right] = \sum_{x \in \Omega} x \mathbb{P}\left[\mathbb{X} = x\right] = \sum_{x=1}^{\infty} x \cdot \frac{1}{2^x} = 2$$

Probability Basics

▲□ ▶ ▲ 三 ▶ ▲ 三 ▶

Theorem (Linearity of Expectation)

Suppose (X_1, X_2) is a joint distribution over the sample space $\Omega_1 \times \Omega_2$ The following holds.

$$\mathbb{E}\left[\mathbb{X}_{1} + \mathbb{X}_{2}\right] = \mathbb{E}\left[\mathbb{X}_{1}\right] + \mathbb{E}\left[\mathbb{X}_{2}\right]$$

We emphasize that this result holds even if \mathbb{X}_1 and \mathbb{X}_2 are correlated!

Think: The proof is left as an exercise.

Indicator Variables

- $\bullet\,$ Let $\mathbb X$ be a random variable over the sample space Ω
- Let $E \subseteq \Omega$ be an event
- Let $f: \Omega \to \{0,1\}$ be the following function

$$f(x) = \begin{cases} 1, & x \in E \\ 0, & x \notin E \end{cases}$$

- The random variable f(X) is referred to as the "indicator variable for the event E"
- It is represented by $\mathbf{1}_{\{E\}}$

Lemma

$$\mathbb{E}\left[\mathbf{1}_{\{E\}}
ight]=\mathbb{P}\left[\mathbb{X}\in E
ight]$$

The proof is left as an exercise.
