Lecture 01: Mathematical Basics (Summations)

• I am assuming that you know asymptotic notations. For example, the big-O, little-O notations

- ∢ ⊒ →

- ∢ ≣ ▶

• Let us try to write a closed form expression for the following summation

$$S = \sum_{i=1}^{n} 1$$

• It is trivial to see that S = n

・ 御 と 《 臣 と 《 臣 と

э

• Now, let us try to write a closed form expression for the following summation

$$S = \sum_{i=1}^{n} i$$

- We can prove that $S = \frac{n(n+1)}{2}$
 - How do you prove this statement? (Use Induction? Use the formula for the Sum of an Arithmetic Progression?)
- Using Asymptotic Notation, we can say that $S = \frac{n^2}{2} + o(n^2)$

(日本) (日本) (日本)

• Now, let us try to write a closed form expression for the following summation

$$S = \sum_{i=1}^{n} i^2$$

- We can prove that $S = \frac{n(n+1)(2n+1)}{6}$
 - Why is the expression on the right an integer? (Prove by induction that 6 divides n(n + 1)(2n + 1) for all positive integer n)
 - How do you prove this statement? (Use Induction?)
- Using Asymptotic Notation, we can say that $S = \frac{n^3}{3} + o(n^3)$

・ 同 ト ・ ヨ ト ・ ヨ ト

- Do we see a pattern here?
- Conjecture: For $k \ge 1$, we have $\sum_{i=1}^{n} i^{k-1} = \frac{n^k}{k} + o(n^k)$.

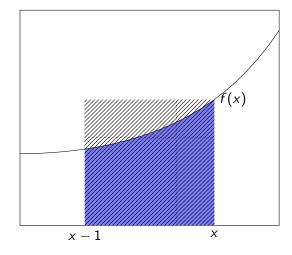

• How do we prove this statement?

伺 ト イヨ ト イヨ ト

- Let f be an increasing function
- For example, f(x) = x^{k-1} is an increasing function for k > 1 and x ≥ 0

Estimating Summations by Integration II

白マ・トレー

Estimating Summations by Integration III

- Observation: "Blue area under the curve" is smaller than the "Shaded area of the rectangle"
 - Blue area under the curve is:

$$\int_{x-1}^{x} f(t) dt$$

• Shaded area of the rectangle is:

f(x)

• So, we have the inequality:

$$\int_{x-1}^x f(t) \, \mathrm{d} t \leqslant f(x)$$

• Summing both side from x = 1 to x = n, we get

$$\sum_{x=1}^{n} \int_{x-1}^{x} f(t) dt \leq \sum_{x=1}^{n} f(x)$$

Basics

Estimating Summations by Integration IV

• The left-hand side of the inequality is

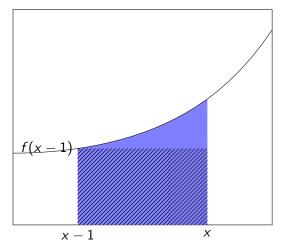

$$\int_0^1 f(t) dt + \int_1^2 f(t) dt + \dots + \int_{n-1}^n f(t) dt = \int_0^n f(t) dt$$

• So, for an increasing f, we have the following lower bound.

$$\int_0^n f(t) \, \mathrm{d}t \leqslant \sum_{x=1}^n f(x) \tag{1}$$

Estimating Summations by Integration V

• Now, we will upper bound the summation expression. Consider the figure below

Estimating Summations by Integration VI

- Observation: "Blue area under the curve" is greater than the "Shaded area of the rectangle"
- So, we have the inequality:

$$\int_{x-1}^{x} f(t) \, \mathrm{d}t \ge f(x-1)$$

- Now we sum the above inequality from x = 2 to x = n + 1
- We get

$$\int_{1}^{2} f(t) dt + \int_{2}^{3} f(t) dt + \dots + \int_{n}^{n+1} f(t) dt \ge f(1) + f(2) + \dots + f(n)$$

• So, for an increasing f, we get the following upper bound

$$\int_{1}^{n+1} f(t) dt \ge \sum_{x=1}^{n} f(x)$$
(2)

Basics

Summary: Estimation of Summation using Integration

Theorem

For an increasing function f, we have

$$\int_0^n f(t) \, \mathrm{d}t \leqslant \sum_{x=1}^n f(x) \leqslant \int_1^{n+1} f(t) \, \mathrm{d}t$$

Exercise:

- Use this theorem to prove that $\sum_{i=1}^{n} i^{k-1} = \frac{n^k}{k} + o(n^k)$, for $k \ge 1$
- Consider the function f(x) = 1/x to find upper and lower bounds for the sum H_n = 1 + ¹/₂ + · · · + ¹/_n using the approach used to prove Theorem 1

Differentiation and Integration

- Differentiation: f'(x) represents the slope of the curve y = f(x) at x
- Integration: $\int_{a}^{b} f(t) dt$ represents the area under the curve y = f(x) between x = a and x = b
- Increasing function:
 - Observation: The slope an increasing function is positive
 - So, "f is increasing at x" is equivalent to "f'(x) > 0," i.e. f' is positive at x
- Suppose we want to mathematically write "Slope of a function *f* is increasing"
 - The "slope of a function f" is the function "f"
 - So, the statement "slope of a function f is increasing" is equivalent to " $(f')' \equiv f''$ is positive"

Definition (Concave Upwards Function)

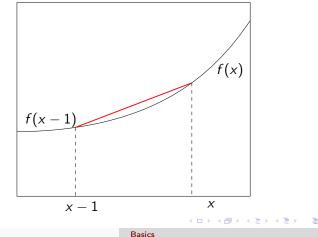

A function f is concave upwards in the interval [a, b] if f'' is positive in the interval [a, b].

- Example of functions that concave upwards: x², exp(x), 1/x (in the interval (0,∞)), x log x (in the interval (0,∞))
 - We emphasize that a "concave upwards" function need not be increasing, for example f(x) = 1/x (for positive x) is decreasing

・ 同 ト ・ ヨ ト ・ ヨ ト

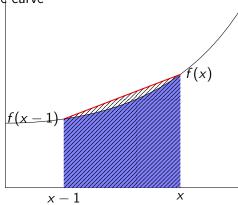

Property of Concave Upwards Function I

- Consider the coordinates (x 1, f(x 1)) and (x, f(x))
- For a concave upwards function, the secant between the two coordinates is always (on or) above the part of the curve *f* between the two coordinates

Property of Concave Upwards Function II

• So, the shaded area of the trapezium is greater than the blue area under the curve

• So, we get
$$rac{f(x-1)+f(x)}{2} \geqslant \int_{x-1}^x f(t) \, \mathrm{d}t$$

- Now, use this new observation to obtain a better lower bound for the sum $\sum_{x=1}^{n} f(x)$
- Think: Can you get even tighter bounds?
- Additional Reading: Read on the "trapezoidal rule"

Estimating Products

- Consider the objective of estimating *n*! using elementary functions
- Note that one can convert this estimation of products into estimation of sums by taking log. For example,

$$\ln(n!) = \sum_{i=1}^{n} \ln(i).$$

Now, one can tightly upper and lower bound the expression
 ∑ⁿ_{i=1} ln(i). Use the techniques in the previous slides to obtain
 meaningful upper and lower bounds of this expression. Suppose

$$L_n \leqslant \sum_{i=1}^n \ln(i) \leqslant U_n.$$

• Therefore, one concludes that

$$\exp(L_n) \leqslant n! \leqslant \exp(U_n).$$

Basics

Estimating Fractions

- Consider the objective of estimating a fraction A_n/B_n
- Suppose we have $A_n \leq U_n$ and $L'_n \leq B_n$. Note that

$$\frac{1}{B_n} \leqslant \frac{1}{L'_n}.$$

• Note that multiplying with $A_n \leq U_n$, one gets that

$$\frac{A_n}{B_n} \leqslant \frac{U_n}{L'_n}.$$

- To summarize, upper-bounding a fraction involves upper-bounding the numerator and lower-bounding the denominator
- Analogously, if $L_n \leq A_n$ and $B_n \leq U'_n$, then we get $\frac{L_n}{U'_n} \leq \frac{A_n}{B_n}$
- Food for thought. Provide meaningful upper and lower bound the expression $\binom{2n}{n} := \frac{(2n)!}{(n!)^2}$.
