

DIRECT LINK COMMUNICATION I: BASIC TECHNIQUES

Data Transmission

Link speed unit: bps

- abstraction
- ignore carrier frequency, coding etc.

Point-to-point link:

- wired or wireless
- includes broadcast case

Interested in *completion time*:

→ time elapsed between sending/receiving first bit

- Single bit:

→ $\approx L/SOL$ (lower bound)

→ latency (or propagation delay)

→ optical fiber, wireless: exact

- Multiple, say S , bits:

→ $\approx L/SOL + S/B$

→ latency + transmission time

Latency vs. transmission time: which dominates?

→ a lot to send, a little to send, ...

→ satellite, Zigbee, WLAN, broadband WAN

Multi-hop link (generalize 2-hop case):

- Case 1: $B_1 = B_2$
 - $2(L/SOL + S/B) + \varepsilon$
 - ε : processing overhead at intermediate node
 - minor detail: impact of packetization
- Case 2: $B_1 < B_2$
- Case 3: $B_1 > B_2$
 - without memory, i.e., buffer: information loss
 - loss rate = $1 - (B_2/B_1)$ at full throttle
 - how much buffer space required for no loss?

Reliable Transmission

Principal methodology: ARQ (Automatic Repeat reQuest)

- use retransmission
- used in both wired/wireless

- function duplication
 - link layer, transport layer, etc.
- alternative: FEC
 - not assured
 - hybrid schemes

Three components:

- timer
- acknowledgment (ACK)
- retransmit

Stop-and-Wait

Assumption: Frame is “lost” due to corruption; discarded by NIC after error detection.

Issue of RTT (Round-Trip Time) & timer management:

- what is proper value of timer?
 - RTT estimation
- easier for single link
 - RTT is more well-behaved
- more difficult for multi-hop path in internetwork
 - latency + queueing effect

Another key problem: not keeping the pipe full.

→ delay-bandwidth product

→ volume of data travelling on the link

High throughput: want to keep the pipe full

Stop-and-wait throughput (bps):

- RTT

- frame size (bits)

→ $\text{throughput} = \text{frame size} / \text{RTT}$

Ex.: Link BW 1.5 Mbps, 45 ms RTT

- delay-bandwidth product:
 - $1.5 \text{ Mbps} \times 45 \text{ ms} = 67.5 \text{ kb} \approx 8 \text{ kB}$
- if frame size 1 kB, then throughput:
 - $1024 \times 8 / 0.045 = 182 \text{ kbps}$
 - utilization: only $182 \text{ kbps} / 1500 \text{ kbps} = 0.121$

Solution: increase frame size

- brute increase of frame size can be problematic
 - bully problem
 - existing LAN frame standards (legacy compatible)
- send blocks of data, i.e., sequence of frames

Sliding Window Protocol

→ send window/block of data

Issues:

- Shield application process from reliability management chore
 - exported semantics: continuous byte stream
 - simple app abstraction: e.g., **read** system call
- Both sender and receiver have limited buffer capacity
 - efficiency: space-bounded computation
 - task: “plug holes & flush”

Simple solution when receiver has infinite buffer capacity:

- sender keeps sending at maximum speed
- receiver informs sender of holes
 - i.e., negative ACK
- sender retransmits missing frames
 - sender's buffer capacity?
 - need for positive ACK?

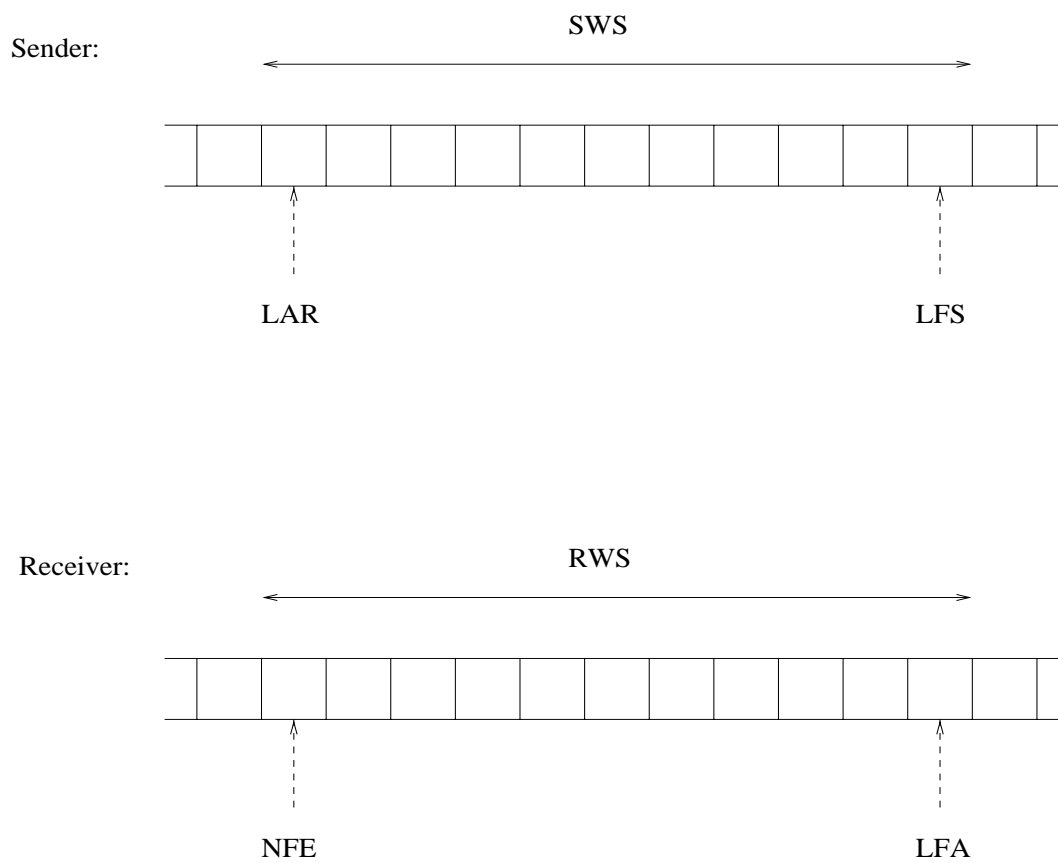

With finite buffer:

- issue of bookkeeping

Flow control & congestion control:

- sending too much is counterproductive
- regulate sending rate

Set-up:

- *SWS*: Sender Window Size (sender buffer size)
- *RWS*: Receiver Window Size (receiver buffer size)
- *LAR*: Last ACK Received
- *LFS*: Last Frame Sent
- *NFE*: Next Frame Expected
- *LFA*: Last Frame Acceptable

Assign sequence numbers to frames.

→ IDs

Maintain invariants:

- $LFA - NFE + 1 \leq RWS$
- $LFS - LAR + 1 \leq SWS$

Sender:

- Receive ACK with sequence number X
- Forwind LAR to X
- Flush buffer up to (but not including) LAR
- Send up to $SWS - (LFS - LAR + 1)$ frames
- Update LFS

Receiver:

- Receive packet with sequence number Y
- Forward to (new) first hole & update NFE
→ NFE need not be $Y + 1$
- Send cumulative ACK (i.e., NFE)
- Flush buffer up to (but not including) NFE to application
- Update $LFA \leftarrow NFE + RWS - 1$

ACK variants:

- piggyback
- negative ACKs
- selective ACKs

Sequence number wrap-around problem:

$$\text{SWS} < (\text{MaxSeqNum} + 1)/2.$$

→ note: stop-and-wait is special binary case
