Privacy Preserving Access Control in Service Oriented Architecture

Rohit Ranchal, Ruchith Fernando, Zhongjun Jin, Pelin Angin, Bharat Bhargava
Computer Science and CERIAS, Purdue University

Motivation

- Lack of visibility
- Loss of control
- Lack of policy communication mechanisms
- Lack of policy enforcement mechanisms
- Information leakage due to attacks
- Information aggregation
- User profiling
- Lack of trust
- Insider abuse
- Inability to handle information disclosure events such as subpoenas

System Components

- E-commerce Service Domain
  - Active Bundle (AB)
  - AB Interceptor
  - Service

System Interactions

- E-commerce Service
  - Selling Services
  - Payment Services
  - Shipping Services

Features

- Data-centric approach
- Self-monitoring ability
- Policy based access control
- Ability to control interactions
- Selective data dissemination
- Context aware dissemination
- Minimal disclosure
- Interaction visibility
- Ability to operate in unknown (untrusted) environment
- Independent of trusted entities

Implementation

- Apache Thrift based AB implementation
- Node.js based SOA architecture
- RESTful services
- XACML based policies
  https://code.google.com/p/absoa

Future Work

- AB protection against malicious receivers
- Performance evaluation

Features

- Data-centric approach
- Self-monitoring ability
- Policy based access control
- Ability to control interactions
- Selective data dissemination
- Context aware dissemination
- Minimal disclosure
- Interaction visibility
- Ability to operate in unknown (untrusted) environment
- Independent of trusted entities
