Programming Languages (graduate) Spring 2025

Week 2
Induction

Today

2

- Generate the induction principle for inductive data types
- Prove properties of inductive data types using induction.

Proof By Case Analysis

3

How would you justify the following claim?

$$b1 \ \&\& \ (b2 \ \&\& \ b3) = (b1 \ \&\& \ b2) \ \&\& \ b3$$

Construct a truth table that enumerates all cases:

P	Q	R	Formula
T	T	T	T
T	T	F	T
T	F	T	T
T	F	F	T
F	T	T	T
F	T	F	T
F	F	T	T
F	F	F	T

Proof By Case Analysis

4

How would you justify the following fact:

For any three numbers n , m and p ,
$$n + (m + p) = (n + m) + p.$$

Infinite number of cases here!

Proof By Induction

5

How would you justify the following fact:

$$\text{For any three numbers } n, m \text{ and } p, \\ n + (m + p) = (n + m) + p.$$

Proof: By induction on n .

First, suppose $n = 0$.

We must show: $0 + (m + p) = (0 + m) + p$.

This follows directly from the definition of addition.

Next, suppose $n = 1 + n'$, where $n' + (m + p) = (n' + m) + p$.

We must show: $(1 + n') + (m + p) = ((1 + n') + m) + p$.

By the definition of $+$, this follows from $1 + (n' + (m + p)) = 1 + ((n' + m) + p)$, which is immediate from the induction hypothesis. **QED.**

Induction Hypothesis

Nat Induction

6

Mathematical Induction for Natural Numbers:

For any predicate P on natural numbers, **if:**

1. $P(0)$
2. $P(n)$ implies $P(n+1)$

Then:

for all n , $P(n)$ holds.

Induction

7

```
Inductive tree : Type :=
```

```
  | leaf
```

```
  | node (x : nat) (lt rt : tree).
```

```
Fixpoint insert (cmp : nat -> nat -> bool)  
                (t : tree) (x : nat) : tree :=
```

```
  match t with
```

```
  | leaf => node x leaf leaf
```

```
  | node y lt rt => if (cmp x y) then node y (insert cmp lt x) rt  
                   else node y lt (insert cmp rt y)
```

```
  end.
```

```
Fixpoint element (t : tree) (n : nat) : bool :=
```

```
  match t with
```

```
  | leaf => false
```

```
  | node y lt rt =>
```

```
    orb (eqb x y) (orb (element eqb lt x) (element eqb rt x))
```

```
  end.
```

Tree Induction

8

Works for trees too:

For any number n , and tree t
element $(\text{insert } t \ n) \ n = \text{true}$.

Proof: By induction on t .

First, suppose $t = \text{leaf}$.

We must show: $\text{element } (\text{insert leaf } n) \ n = \text{true}$.

This follows directly from the definition of element.

Tree Induction

9

Works for trees too:

For any number n , and tree t
element $(\text{insert } t \ n) \ n = \text{true}$.

Induction Hypothesis

Proof: By induction on t .

Next, suppose $t = \text{node } n' \ \text{lt} \ \text{rt}$ where

element $(\text{insert } \text{lt} \ n) \ n = \text{true}$ and element $(\text{insert } \text{rt} \ n) \ n = \text{true}$.

We must show: element $(\text{insert } (\text{node } n' \ \text{lt} \ \text{rt}) \ n) \ n = \text{true}$.

By definition, this is equivalent to:

element **if** $(\text{cmp } n \ n')$ **then** node n' $(\text{insert } \text{cmp} \ \text{lt} \ n) \ \text{rt}$
else node y $\text{lt} \ (\text{insert } \text{cmp} \ \text{rt} \ n)$

★ Consider the case when $\text{cmp } n \ n' = \text{true}$.

We must show: element $(\text{node } n' \ (\text{insert } \text{cmp} \ \text{lt} \ n) \ \text{rt}) \ n = \text{true}$.

This follows from the IH.

★ Consider the case when $\text{cmp } n \ n' = \text{false}$.

We must show: element $(\text{node } n' \ \text{lt} \ (\text{insert } \text{cmp} \ \text{rt} \ n)) \ n = \text{true}$.

This follows from the IH.

Tree Induction

10

Works for trees too:

Mathematical Induction for Binary Trees:

For any predicate Q on binary trees, **if:**

1. $Q(\text{leaf})$
2. $Q(t_1)$ and $Q(t_2)$ implies $Q(\text{node } n \ t_1 \ t_2)$

Then:

for all t , $Q(t)$ holds.

ADT Induction

11

Principle of Mathematical Induction:

For any algebraic datatype T with constructors $c_1 \dots c_n$,

For any predicate Q on T , **if:**

1. $Q(v_1)$ and $Q(v_2)$ and ... $Q(v_j)$ implies $Q(c_1 v_1 \dots v_j)$

2. $Q(v_1)$ and $Q(v_2)$ and ... $Q(v_j)$ implies $Q(c_2 v_1 \dots v_j)$

...

n. $Q(v_1)$ and $Q(v_2)$ and ... $Q(v_j)$ implies $Q(c_n v_1 \dots v_j)$

Then:

for all t , $Q(t)$ holds.

```
Inductive list {X : Type} : Type :=  
  | nil  
  | cons (x : X) (l : list).
```

Mathematical Induction for Lists:

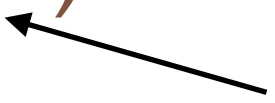

For any predicate Q on lists, **if:**

1. $Q(\text{nil})$
2. $Q(l)$ implies $Q(\text{cons } x \ l)$

Then:

for all l , $Q(l)$ holds.

*a list constructed by adding x
to the head of l*

Induction on syntax trees

13

```
Inductive aexp : Type :=  
  | ANum (a : nat)  
  | APlus (a1 a2 : aexp)  
  | AMinus (a1 a2 : aexp)  
  | AMult (a1 a2 : aexp).
```

```
Fixpoint aexp_opt_zero (a : aexp) : aexp :=  
  match a with  
    | ANum n => ANum n  
    | APlus (ANum 0) e2 => aexp_opt_plus e2  
    | APlus e1 e2 => APlus (aexp_opt_plus e1) (aexp_opt_plus e2)  
    | AMinus e1 e2 => AMinus (aexp_opt_plus e1) (aexp_opt_plus e2)  
    | AMult e1 e2 => AMult (aexp_opt_plus e1) (aexp_opt_plus e2)  
  end.
```

Induction on syntax trees

14

- Works for abstract syntax trees too!
- Using ADT induction, we can prove in Coq:

Theorem `aexp_opt_zero_sound`
: `forall a, aeval (aexp_opt_zero a) = aeval a.`

Proof.

`induction a.`

- ...

- ...

Qed.
